AWS Secret Region Guide

The GigaVUE Cloud Suite for Customer Orchestration option consists of the following components:

- **GigaVUE® Fabric Manager (GigaVUE-FM)**- GigaVUE-FM is a web-based fabric management and orchestration interface that provides a single pane of glass visibility, management, and orchestration of both the physical and virtual traffic that form the GigaVUE Cloud Suite Cloud.
- **G-vTAP Agents** -G-vTAP Agent is an agent that is installed in your Virtual Machine (VM). This agent mirrors the selected traffic from the VMs to the GigaVUE® V Series node.
- **G-vTAP Controllers**- G-vTAP Controller manages multiple G-vTAP Agents and orchestrates the flow of mirrored traffic to GigaVUE V Series nodes.
- **GigaVUE V Series Proxy (Optional)**- GigaVUE® V Series Proxy manages multiple V Series nodes and orchestrates the flow of traffic from GigaVUE V Series nodes to the monitoring tools
- **GigaVUE V Series Nodes** -GigaVUE® V Series Node is a visibility node that aggregates mirrored traffic from multiple G-vTAP Agents. It applies filters, manipulates the packets using GigaSMART applications, and distributes the optimized traffic to cloud-based tools or backhaul to GigaVUE Cloud Suite Cloud using GRE or VXLAN tunnels, provided the cloud platform supports

The images of all the fabric components are available in the [Gigamon Customer Portal](#) and the AWS Market Place. You can use the images that are published in the marketplace. For information about installing GigaVUE-FM in your enterprise data center, refer to the *GigaVUE-FM Installation, Migration, and Upgrade Guide*.

Prerequisites

This section lists the minimum requirements that are required for deploying the fabric components:

1. GigaVUE V Series Node requires a minimum of two network interfaces (NIC). Both can be on the same subnet or different subnets.
2. GigaVUE V Series Node requires a minimum of one Management interface (MGMT). Management interface is used for communicating between GigaVUE-FM and V Series Node.
3. GigaVUE V Series Node requires a minimum of one Data/Tunnel interface.
4. The minimum system requirements for a G-vTAP Controller and V Series Proxy is 1CPU/1GB RAM.

Network Firewall Requirement

Following is the Network Firewall Requirements for V Series 2 node deployment.

Direction	Type	Protocol	Port	CIDR	Purpose
GigaVUE-FM					
Inbound	<ul style="list-style-type: none"> HTTPS SSH 	TCP	<ul style="list-style-type: none"> 443 22 	Administrator Subnet	Management connection to GigaVUE-FM
Inbound	Custom TCP Rule	TCP	5671	V Series 2 Node IP	Allows GigaVUE V Series 2 Nodes to send traffic health updates to GigaVUE-FM Allows Next Generation G-vTAP Agents to send statistics to GigaVUE-FM.
Outbound	Custom TCP Rule	TCP(6)	9900	GigaVUE-FM IP	Allows G-vTAP Controller to communicate with GigaVUE-FM
Outbound (optional)	Custom TCP Rule	TCP	8890	V Series Proxy IP	Allows GigaVUE-FM to communicate with V Series Proxy
Outbound	Custom TCP Rule	TCP	8889	V Series 2 Node IP	Allows GigaVUE-FM to communicate with GigaVUE V Series node
G-vTAP Controller					
Inbound	Custom TCP Rule	TCP(6)	9900	GigaVUE-FM IP	Allows G-vTAP Controller to communicate with GigaVUE-FM

Prepare G-vTAP Agent to Monitor Traffic

A G-vTAP Agent is the primary Gigamon monitoring module that is installed in your Virtual Machines (VMs). G-vTAP mirrors the selected traffic from a source interface to a destination mirror interface. The mirrored traffic is encapsulated using GRE or VXLAN tunneling and then sent to the GigaVUE Cloud Suite® V Series node.

NOTE: The G-vTAP Agent installation is applicable only when the G-vTAP is your traffic acquisition method.

A G-vTAP Agent consists of a source interface and a destination interface. The network packets collected from the source interface are sent to the destination interface. From the destination interface, the packets traverse through the L2GRE/VXLAN tunnel interface.

A source interface can be configured with one or more ENIs. While configuring a source interface, you can specify the direction of the traffic to be monitored in the instance. The direction of the traffic can be egress or ingress or both.

NOTE: For environments with both Windows and Linux agents or just windows agents, VXLAN tunnels in the G-vTAP controller specification is required.

Refer to the following sections for more information:

- [Linux G-vTAP Agent Installation](#)
- [Windows G-vTAP Agent Installation](#)
- [Create Images with Agent Installed](#)

Refer [Troubleshoot AWS Cloud Issues](#) to resolve G-vTAP deployment issues.

Linux G-vTAP Agent Installation

Refer to the following sections for the Linux agent installation:

- [Single ENI Configuration](#)
- [Dual ENI Configuration](#)
- [Install G-vTAP Agents](#)

Single ENI Configuration

A single ENI acts both as the source and the destination interface. A G-vTAP Agent with a single ENI configuration lets you monitor the ingress or egress traffic from the ENI. The monitored traffic is sent out using the same ENI.

For example, assume that there is only one interface eth0 in the monitoring instance. In the G-vTAP configuration, you can configure eth0 as the source and the destination interface, and specify both egress and ingress traffic to be selected for monitoring purpose. The egress and ingress traffic from eth0 is mirrored and sent out using the same interface.

Using a single ENI as the source and the destination interface can sometimes cause increased latency in sending the traffic out from the instance.

Dual ENI Configuration

A G-vTAP Agent lets you configure two ENIs. One ENI can be configured as the source interface and another ENI can be configured as the destination interface.

For example, assume that there is eth0 and eth1 in the monitoring instance. In the G-vTAP Agent configuration, eth0 can be configured as the source interface and egress traffic can be selected for monitoring purpose. The eth1 interface can be configured as the destination interface. So, the mirrored traffic from eth0 is sent to eth1. From eth1, the traffic is sent to the GigaVUE V Series node.

Install G-vTAP Agents

You must have sudo/root access to edit the G-vTAP Agent configuration file.

For dual or multiple ENI configuration, you may need to modify the network configuration files to make sure that the extra NIC/ENI will initialize at boot time.

NOTE: Before installing G-vTAP Agent **.deb** or **.rpm** packages on your Linux VMs, you must install packages like Python3 and Python modules (netifaces, urllib3, and requests). Package iproute-tc is also required on RHEL and CentOS VMs.

You can install the G-vTAP Agents either from Debian or RPM packages.

Refer to the following topics for details:

- [Install G-vTAP from Ubuntu/Debian Package](#)
- [Install G-vTAP from RPM package](#)
- [Install G-vTAP from Red Hat Enterprise Linux and CentOS with Selinux Enabled](#)

Install G-vTAP from Ubuntu/Debian Package

To install from a Debian package:

1. Download the G-vTAP Agent 6.2.00 Debian (.deb) package from the [Gigamon Customer Portal](#). For assistance contact [Gigamon Technical Support](#).
2. Copy this package to your instance. Install the package with root privileges, for example:

```
$ ls gvtap-agent_6.2.00_amd64.deb
$ sudo dpkg -i gvtap-agent_6.2.00_amd64.deb
```
3. Once the G-vTAP package is installed, modify the file `/etc/gvtap-agent/gvtap-agent.conf` to configure and register the source and destination interfaces. The following examples registers eth0 as the mirror source for both ingress and egress traffic and eth1 as the destination for this traffic:

NOTE: Any changes to the GvTAP agent config file made after the initial setup require an agent restart and an inventory refresh or sync from GigaVUE-FM to pick up the new changes and re-initiate the traffic mirroring. When you have an active, successful monitoring session deployed, modifying the GvTAP config file results in traffic loss until GigaVUE-FM does a periodic sync on its own every 15 minutes.

Example 1—Configuration example to monitor ingress and egress traffic at interface eth0 and use the same interface to send out the mirrored packets

```
# eth0 mirror-src-ingress mirror-src-egress mirror-dst
```

Example 2—Configuration example to monitor ingress and egress traffic at interface eth0 and use the interface eth1 to send out the mirrored packets

```
# eth0 mirror-src-ingress mirror-src-egress
# eth1 mirror-dst
```

Example 3—Configuration example to monitor ingress and egress traffic at interface eth0 and eth 1; use the interface eth1 to send out the mirrored packets

```
# eth0 mirror-src-ingress mirror-src-egress
# eth1 mirror-src-ingress mirror-src-egress mirror-dst
```

4. Save the file.

5. To enable the third-party orchestration, a configuration file `/etc/gigamon-cloud.conf` needs to be created with the following contents:

```
Registration:
  groupName: <Monitoring Domain Name>
  subGroupName: <VPC ID>
  user: orchestration
  password: orchestration123A!
  remoteIP: <controller list IP addresses separated by comma>
  remotePort: 8891
```

6. Reboot the instance.

The G-vTAP Agent status will be displayed as running. Check the status using the following command:

```
$ sudo /etc/init.d/gvtap-agent status
G-vTAP Agent is running
```

Install G-vTAP from RPM package

To install from an RPM (.rpm) package on a Redhat, CentOS, or other RPM-based system:

1. Download the G-vTAP Agent 6.2.00 RPM (.rpm) package from the [Gigamon Customer Portal](#). For assistance contact [Gigamon Technical Support](#).
2. Copy this package to your instance. Install the package with root privileges, for example:

```
$ ls gvtap-agent_6.2.00_x86_64.rpm
$ sudo rpm -i gvtap-agent_6.2.00_x86_64.rpm
```

3. Modify the `/etc/gvtap-agent/gvtap-agent.conf` file to configure and register the source and destination interfaces. The following example registers the `eth0` as the mirror source for both ingress and egress traffic and registers `eth1` as the destination for this traffic as follows:

NOTE: Any changes to the GvTAP agent config file made after the initial setup require an agent restart and an inventory refresh or sync from GigaVUE-FM to pick up the new changes and re-initiate the traffic mirroring. When you have an active, successful monitoring session deployed, modifying the GvTAP config file results in traffic loss until GigaVUE-FM does a periodic sync on its own every 15 minutes.

Example 1—Configuration example to monitor ingress and egress traffic at interface `eth0` and use the same interface to send out the mirrored packets

```
# eth0 mirror-src-ingress mirror-src-egress mirror-dst
```

Example 2—Configuration example to monitor ingress and egress traffic at interface `eth0` and use the interface `eth1` to send out the mirrored packets

```
# eth0 mirror-src-ingress mirror-src-egress# eth1 mirror-dst
```

Example 3—Configuration example to monitor ingress and egress traffic at interface `eth0` and `eth 1`; use the interface `eth1` to send out the mirrored packets

```
# eth0 mirror-src-ingress mirror-src-egress# eth1 mirror-src-
  ingress mirror-src-egress mirror-dst
```

4. Save the file.
5. To enable the third-party orchestration, a configuration file `/etc/gigamon-cloud.conf` needs to be created with the following contents:

```
Registration:
  groupName: <Monitoring Domain Name>
  subGroupName: <VPC ID>
  user: orchestration
  password: orchestration123A!
  remoteIP: <controller list IP addresses separated by comma>
  remotePort: 8891
```

6. Reboot the instance.

Check the status with the following command:

```
$ sudo service gvtap-agent status
G-vTAP Agent is running
```

Install G-vTAP from Red Hat Enterprise Linux and CentOS with Selinux Enabled

1. Launch the RHEL/CentOS agent AMI image.
2. Download the following packages from the [Gigamon Customer Portal](#). For assistance contact [Gigamon Technical Support](#).
 - gvtap-agent_6.2.00_x86_64.rpm
 - gvtap.te files (type enforcement files)
3. Copy the downloaded G-vTAP package files to G-vTAP Agent.
4. Checkmodule -M -m -o gvtap.mod gvtap.te

```
semodule_package -o gvtap.pp -m gvtap.mod
sudo semodule -i gvtap.pp
```
5. Install G-vTAP Agent package:

```
sudo rpm -ivh gvtap-agent_6.2.00_x86_64.rpm
```
6. Edit gvtap-agent.conf file to configure the required interface as source/destination for mirror:

NOTE: Any changes to the GvTAP agent config file made after the initial setup require an agent restart and an inventory refresh or sync from GigaVUE-FM to pick up the new changes and re-initiate the traffic mirroring. When you have an active, successful monitoring session deployed, modifying the GvTAP config file results in traffic loss until GigaVUE-FM does a periodic sync on its own every 15 minutes.

```
# eth0 mirror-src-ingress mirror-src-egress mirror-dst
# sudo /etc/init.d/gvtap-agent restart
```

7. Reboot the instance.

Windows G-vTAP Agent Installation

Windows G-vTAP Agent allows you to select the network interfaces by subnet/CIDR and modify the corresponding monitoring permissions in the configuration file. This gives you more granular control over what traffic is monitored and mirrored.

VXLAN is the only supported tunnel type for Windows G-vTAP Agent.

Windows G-vTAP Agent Installation Using MSI Package

To install the Windows G-vTAP Agent using the MSI file:

1. Download the Windows G-vTAP Agent 6.2.00 MSI package from the [Gigamon Customer Portal](#). For assistance contact [Gigamon Technical Support](#).
2. Install the downloaded MSI package as **Administrator** and the G-vTAP Agent service starts automatically.

- Once the G-vTAP package is installed, modify the file `C:\ProgramData\Gvtap-agent\gvtap-agent.conf` to configure and register the source and destination interfaces.

NOTE: Any changes to the GvTAP agent config file made after the initial setup require an agent restart and an inventory refresh or sync from GigaVUE-FM to pick up the new changes and re-initiate the traffic mirroring. When you have an active, successful monitoring session deployed, modifying the GvTAP config file results in traffic loss until GigaVUE-FM does a periodic sync on its own every 15 minutes.

Following are the rules to modify the G-vTAP configuration file:

- Interface is selected by matching its CIDR address with config entries.
- For the VMs with single interface (*.conf file modification is optional*):
 - if neither mirror-src permissions is granted to the interface, both mirror-src-ingress and mirror-src-egress are granted to it.
 - mirror-dst is always granted implicitly to the interface.
- For the VMs with multiple interfaces:
 - mirror-dst needs to be granted explicitly in the config file. Only the first matched interface is selected for mirror-dst, all other matched interfaces are ignored.
 - if none interfaces is granted any mirror-src permission, all interfaces will be granted mirror-src-ingress and mirror-src-egress.

Example 1—Configuration example to monitor ingress and egress traffic at interface 192.168.1.0/24 and use the same interface to send out the mirrored packets.

```
192.168.1.0/24 mirror-src-ingress mirror-src-egress mirror-dst
```

Example 2—Configuration example to monitor ingress and egress traffic at interface 192.168.1.0/24 and use the interface 192.168.2.0/24 to send out the mirrored packets.

```
192.168.1.0/24 mirror-src-ingress mirror-src-egress
192.168.2.0/24 mirror-dst
```

- Save the file.
- To enable the third-party orchestration, a configuration file `C:\ProgramData\Gvtap-agent\gigamon-cloud.conf` needs to be created with the following contents:

```
Registration:
  groupName: <Monitoring Domain Name>
  subGroupName: <VPC ID>
  user: orchestration
  password: orchestration123A!
  remoteIP: <controller list IP addresses separated by comma>
  remotePort: 8891
```

6. To restart the Windows G-vTAP Agent, perform one of the following actions:
 - Restart the VM.
 - Run 'sc stop gvtap' and 'sc start gvtap' from the command prompt.
 - Restart the G-vTAP Agent from the Windows Task Manager.

You can check the status of the G-vTAP Agent in the Service tab of the Windows Task Manager.

Windows G-vTAP Agent Installation Using ZIP Package

To install the Windows G-vTAP Agent using the ZIP package:

1. Download the Windows G-vTAP Agent 6.2.00 ZIP package from the [Gigamon Customer Portal](#). For assistance contact [Gigamon Technical Support](#).
2. Extract the contents of the .zip file into a convenient location.
3. Run 'install.bat' as an **Administrator** and the G-vTAP Agent service starts automatically.

- Once the G-vTAP package is installed, modify the file `C:\ProgramData\Gvtap-agent\gvtap-agent.conf` to configure and register the source and destination interfaces.

NOTE: Any changes to the GvTAP agent config file made after the initial setup require an agent restart and an inventory refresh or sync from GigaVUE-FM to pick up the new changes and re-initiate the traffic mirroring. When you have an active, successful monitoring session deployed, modifying the GvTAP config file results in traffic loss until GigaVUE-FM does a periodic sync on its own every 15 minutes.

Following are the rules to modify the G-vTAP configuration file:

- Interface is selected by matching its CIDR address with config entries.
- For the VMs with single interface (*.conf file modification is optional*):
 - if neither mirror-src permissions is granted to the interface, both mirror-src-ingress and mirror-src-egress are granted to it.
 - mirror-dst is always granted implicitly to the interface.
- For the VMs with multiple interfaces:
 - mirror-dst needs to be granted explicitly in the config file. Only the first matched interface is selected for mirror-dst, all other matched interfaces are ignored.
 - if none interfaces is granted any mirror-src permission, all interfaces will be granted mirror-src-ingress and mirror-src-egress.

Example 1—Configuration example to monitor ingress and egress traffic at interface 192.168.1.0/24 and use the same interface to send out the mirrored packets.

```
192.168.1.0/24 mirror-src-ingress mirror-src-egress mirror-dst
```

Example 2—Configuration example to monitor ingress and egress traffic at interface 192.168.1.0/24 and use the interface 192.168.2.0/24 to send out the mirrored packets.

```
192.168.1.0/24 mirror-src-ingress mirror-src-egress
192.168.2.0/24 mirror-dst
```

- Save the file.
- To enable the third-party orchestration, a configuration file `C:\ProgramData\Gvtap-agent\gigamon-cloud.conf` needs to be created with the following contents:

```
Registration:
  groupName: <Monitoring Domain Name>
  subGroupName: <VPC ID>
  user: orchestration
  password: orchestration123A!
  remoteIP: <controller list IP addresses separated by comma>
  remotePort: 8891
```

7. To restart the Windows G-vTAP Agent, perform one of the following actions:
 - Restart the VM.
 - Run 'sc stop gvtap' and 'sc start gvtap' from the command prompt.
 - Restart the G-vTAP Agent from the Windows Task Manager.

You can check the status of the G-vTAP Agent in the Service tab of the Windows Task Manager.

NOTE: You must edit the Windows Firewall settings to grant access to the gvtap process. To do this, access the Windows Firewall settings and find “gvtapd” in the list of apps and features. Select it to grant access. Be sure to select both Private and Public check boxes. If “gvtapd” does not appear in the list, click **Add another app...** Browse your program files for the gvtap-agent application (gvtapd.exe) and then click **Add.** (**Disclaimer:** These are general guidelines for changing Windows Firewall settings. See Microsoft Windows help for official instructions on Windows functionality.)

Create Images with Agent Installed

If you want to avoid downloading and installing the G-vTAP Agents every time there is a new instance to be monitored, you can save the G-vTAP Agent running on an instance as a private AMI.

To save the G-vTAP Agent as an AMI from your EC2 console, right click on the instance and navigate to **Image > Create Image.**

Configure GigaVUE Fabric Components

You can use your own orchestration system to deploy the GigaVUE fabric components instead of using GigaVUE-FM to deploy the fabric components.

The GigaVUE fabric components register themselves with GigaVUE-FM using the information provided by you. Once the nodes are registered with GigaVUE-FM, you can configure monitoring sessions and related services in GigaVUE-FM. After launching the fabric component images in your orchestration system use the registration data provided in the sections below to deploy your fabric components to GigaVUE-FM. Health status of the registered nodes is determined by the heartbeat messages sent from the respective nodes.

This section provides step-by-step information on how to register GigaVUE fabric components using your own orchestration system or a configuration file.

Configure G-vTAP Controller

You can configure more than one G-vTAP Controller in a monitoring domain.

To register G-vTAP Controller after launching the instance using a configuration file, follow the steps given below:

1. Log in to the G-vTAP Controller.
2. Create a local configuration file (`/etc/gigamon-cloud.conf`) and enter the following custom data.

Registration:

```
groupName: <Monitoring Domain Name>
subGroupName: <VPC ID>
user: orchestration
password: orchestration123A!
remoteIP: <IP address of the GigaVUE-FM>
remotePort: 443
```

3. Restart the G-vTAP Controller service.

```
$ sudo service gvtap-cntlr restart
```

The deployed G-vTAP Controller registers with the GigaVUE-FM.

Configure G-vTAP Agent

G-vTAP Agent should be registered via the registered G-vTAP Controller and communicates through PORT 8891.

NOTE: You can configure more than one G-vTAP Controller for a G-vTAP Agent, so that if one G-vTAP Controller goes down, the G-vTAP Agent registration will happen through another Controller that is active.

To register G-vTAP Agent after launching the instance using a configuration file, refer to [Configure GigaVUE Fabric Components](#) topic for more detailed information.

Configure GigaVUE V Series Node and GigaVUE V Series Proxy

NOTE: It is not mandatory to register GigaVUE V Series Nodes via V Series proxy. However, if there are a large number of nodes connected to GigaVUE-FM or if you do not wish to reveal the IP addresses of the nodes, then you can register your nodes using GigaVUE V Series Proxy. In this case, GigaVUE-FM communicates with GigaVUE V Series Proxy to manage the GigaVUE V Series Nodes.

To register GigaVUE V Series Proxy or node after launching the instance using a configuration file, perform the following steps:

1. Log in to the GigaVUE V Series Proxy or Node.
2. Create a local configuration file (`/etc/gigamon-cloud.conf`) and enter the following custom data.

Registration:

```
groupName: <Monitoring Domain Name>
subGroupName: <VPC ID>
user: orchestration
password: orchestration123A!
remoteIP: <IP address of the GigaVUE-FM> or
          <IP address of the Proxy>
remotePort: 443
```

- You can register your GigaVUE V Series Node directly with GigaVUE-FM or you can use V Series proxy to register your GigaVUE V Series node with GigaVUE-FM. If you wish to register GigaVUE V Series Node directly, enter the `remotePort` value as 443 and the `remoteIP` as *<IP address of the GigaVUE-FM>* or if you wish to deploy GigaVUE V Series node using GigaVUE V Series proxy then, enter the `remotePort` value as 8891 and `remoteIP` as *<IP address of the Proxy>*.
- Use only the default `user` and `password` details given in the custom data.

3. Restart the GigaVUE V Series proxy or node service.

- GigaVUE V Series node:
\$ `sudo service vseries-node restart`
- GigaVUE V Series proxy:
\$ `sudo service vps restart`

The deployed GigaVUE V Series proxy or node registers with the GigaVUE-FM.

After successful registration, the fabric components send heartbeat messages to GigaVUE-FM every 30 seconds. If one heartbeat is missing, the fabric node status appears as 'Unhealthy'. If more than five heartbeats fail to reach GigaVUE-FM, GigaVUE-FM tries to reach the fabric components and if that fails GigaVUE-FM unregisters the fabric component and it will be removed from GigaVUE-FM.

In the monitoring domain page you can view all the deployed fabric components and G-vTAP Agents.

Configure and Manage Resources

GigaVUE-FM automatically collects inventory data on all target instances available in your environment. You can design your monitoring session to include or exclude the instances that you want to monitor. You can also choose to monitor egress, ingress, or all traffic.

When a new target instance is added to your cloud environment, GigaVUE-FM automatically detects and adds the instance into your monitoring session. Similarly, when an instance is removed, it updates the monitoring sessions.

To design your monitoring session, refer to the following sections:

- [Create a Monitoring Session](#)
- [Create Tunnel Endpoint](#)
- [Create a New Map](#)
- [Add Applications \(GigaVUE V Series 2\)](#)
- [Deploy Monitoring Session](#)
- [View Monitoring Session Statistics](#)
- [Visualize the Network Topology](#)

Create a Monitoring Session

To create a new session:

1. From the left navigation pane, select **Traffic > VIRTUAL > Orchestrated Flows > AnyCloud**. The Monitoring Session page appears.
2. In the Monitoring Session page, click **New**. The **Create a New Monitoring Session** window appears.

Create A New Monitoring Session

Alias	Alias
Monitoring Domain	<input type="text" value="Select domain..."/>

3. Enter the appropriate information in the Monitoring Session Info as described in the following table.

Field	Description
Alias	The name of the monitoring session.
Monitoring Domain	The name of the monitoring domain.
Agent Pre-filtering	When enabled, traffic is filtered at the G-vTAP Agent-level, before mirroring to the V Series Nodes, which reduces the load on the V Series Nodes and the Cloud networks. Refer to Agent Pre-filtering.

4. Click **Create**.

Create Tunnel Endpoint

The customized traffic from the GigaVUE V Series node is distributed to the tunnel endpoints.

To create a new tunnel endpoint:

1. After creating a new monitoring session, or click **Edit** on an existing monitoring session, the GigaVUE-FM canvas appears.
2. In the canvas, select **New > New Tunnel**, drag and drop a new tunnel template to the workspace. The **Add Tunnel Spec** quick view appears.
3. On the New Tunnel quick view, enter or select the required information as described in the following table.

Field	Description
Alias	The name of the tunnel endpoint. NOTE: Do not enter spaces in the alias name.
Description	The description of the tunnel endpoint.
Type	The type of the tunnel. Select L2GRE or VXLAN to create a tunnel. If you choose VXLAN, you must enter the remote tunnel port.
Traffic Direction	The direction of the traffic flowing through the GigaVUE V Series node. Choose Out for creating a tunnel from the GigaVUE V Series node to the destination endpoint. NOTE: Traffic Direction In is not supported in the current release.
Remote Tunnel IP	The IP address of the tool. NOTE: You cannot create two tunnels from a GigaVUE V Series node to the same IP address.
Remote Tunnel Port	Port number for the tunnel end point.

4. Click **Save**.

To delete a tunnel, select the required tunnel and click **Delete**.

Create a New Map

Each map can have up to 32 rules associated with it. The following table lists the various rule conditions that you can select for creating a map, inclusion map, and exclusion map.

Conditions	Description
L2, L3, and L4 Filters	
EtherType	<p>The packets are filtered based on the selected ethertype. The following conditions are displayed:</p> <ul style="list-style-type: none"> ■ IPv4 ■ IPv6 ■ ARP ■ RARP ■ Other <p>L3 Filters</p> <p>If you choose IPv4 or IPv6, the following L3 filter conditions are displayed:</p> <ul style="list-style-type: none"> ■ Protocol ■ IP Fragmentation ■ IP Time to live (TTL) ■ IP Type of Service (TOS) ■ IP Explicit Congestion Notification (ECN) ■ IP Source ■ IP Destination <p>L4 Filters</p> <p>If you select TCP or UDP protocol, the following L4 filter conditions are displayed:</p> <ul style="list-style-type: none"> ■ Port Source ■ Port Destination
MAC Source	The egress traffic from the VMs matching the specified source MAC address is selected.
MAC Destination	The ingress traffic from the VMs matching the specified destination MAC address is selected.
VLAN	All the traffic matching the specified IEEE 802.1q Virtual LAN tag is filtered. Specify a number from 0 to 4094.
VLAN Priority Code Point (PCP)	All the traffic matching the specified IEEE 802.1q Priority Code Point (PCP) is filtered. Specify a value between 0 to 7.
VLAN Tag Control Information (TCI)	All the traffic matching the specified VLAN TCI value is filtered. Specify the exact TCI value.
Pass All	All the packets coming from the monitored instances are passed through the filter. When Pass All is selected, the L3 and L4 filters are disabled.

When you select a condition without source or destination specified, then both egress and ingress traffic is selected for monitoring the traffic. For example, if you select IPv4 as the EtherType, TCP as the protocol, and do not specify IP source or destination, then both egress and ingress traffic is selected for monitoring purpose.

When you select a condition with either source or destination specified, it determines the direction based on the selection.

NOTE: You can create Inclusion and Exclusion Maps using all default conditions except EtherType and Pass All.

To create a new map:

1. In the Monitoring Session canvas, from **Maps** section, drag and drop a new map template to the workspace. If you are creating an exclusion or inclusion map, drag and drop a new map template to their respective section at the bottom of the workspace. The new map page is displayed.

2. Enter the appropriate information for creating a new map as described in the following table.

Parameter	Description
Alias	The name of the new map. NOTE: The name can contain alphanumeric characters with no spaces.
Comments	The description of the map.
Map Rules	The rules for filtering the traffic in the map. To add a map rule: <ol style="list-style-type: none"> a. Click Add a Rule. b. Select a condition from the Search L2 Conditions drop-down list and specify a value. Based on this selection, the Search L3 Conditions drop-down list is automatically updated. c. Select a condition from the Search L3 Conditions drop-down list and specify a value. d. (Optional) If you have selected TCP or UDP as the protocol in the L3 conditions, then select Port Source or Port Destination from the Search L4 Conditions drop-down list and specify a value. If you have selected conditions other than TCP or UDP, then the Search L4 Conditions drop-down list is disabled.
Map Rules	<ol style="list-style-type: none"> e. (Optional) In the Priority and Action Set box, assign a priority and action set. f. (Optional) In the Rule Comment box, enter a comment for the rule. NOTE: <ul style="list-style-type: none"> • Repeat steps b through f to add more conditions. • Repeat steps a through f to add nested rules.

NOTE: Do not create duplicate map rules with the same priority.

3. To reuse the map, click **Add to Library**. Save the map using one of the following options:
- Select an existing group from the **Select Group** list and click **Save**.
 - Enter a name for the new group in the **New Group** field and click **Save**.

NOTE: The maps saved in the Map Library can be reused in any monitoring session present in the VNet.

4. Click **Save**.

To edit or delete a map, click a map and select **Details** to edit the map or **Delete** to delete the map as shown in the following figure.

Click the **Show Targets** button to view the monitoring targets highlighted in orange.

Click  to expand the **Targets** dialog box. Click  to change the view from topology to viewing the target VM names. To view more details about the instance tag name, direction of tapping, and so on, click the arrow next to the instance name.

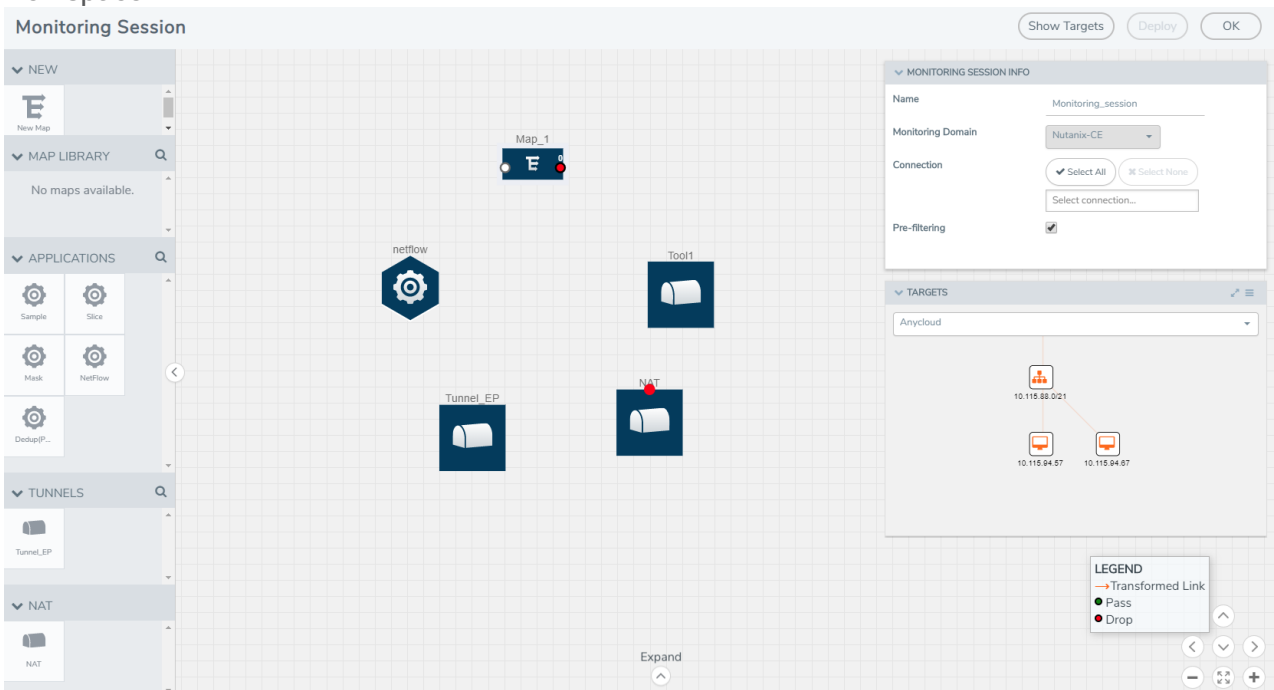

Deploy Monitoring Session

To deploy the monitoring session:

1. Drag and drop one or more maps from the **MAP Library** to the workspace.
2. (Optional) To add Inclusion and Exclusion maps, drag and drop the maps from the Map Library to their respective section at the bottom of the workspace.
3. (Optional) Drag and drop one or more applications from the APPLICATIONS section to the workspace.

NOTE: For information about adding applications to the workspace, refer to [Add Applications \(GigaVUE V Series 2\)](#).

4. Drag and drop one or more tunnels from the TUNNELS section. The following figure illustrates three maps, one exclusion map, one application, and two tunnel endpoints dragged and dropped to the workspace.

You can add up to 8 links from a action set to different maps, applications, or monitoring tools.

5. Hover your mouse on the application, click the red dot, and drag the link (arrow) over to the tunnel endpoints. The traffic matching the rules in each action set is routed to maps, applications, or monitoring tools.

6. Click **Show Targets** to view details about the subnets and monitoring instances. The instances and the subnets that are being monitored are highlighted in orange.
7. Click **Deploy** to deploy the monitoring session. The status is displayed as **Success** in the Monitoring Sessions page. The session is successfully deployed on all GigaVUE V Series nodes and G-vTAP Agents. If the monitoring session is not deployed properly, then one of the following errors is displayed:
 - **Partial Success**—The session is not deployed on one or more instances due to G-vTAP or GigaVUE V Series node failure.
 - **Failure**—The session is not deployed on any of the GigaVUE V Series nodes and G-vTAP Agents. Click on the status link to view the reason for the partial success or failure.
8. Click **View** under Statistics to view and analyze the incoming and outgoing traffic.

You can also do the following in the Monitoring Session page:

- Use the **Clone** button to duplicate the selected monitoring session.
- Use the **Edit** button to edit the selected monitoring session.
- Use the **Delete** button to delete the selected monitoring session.

View Monitoring Session Statistics

The Monitoring Session Statistics page lets you analyze the incoming and outgoing traffic on an hourly, daily, weekly, and monthly basis. The traffic can be viewed based on kilobits/second, megabits/second or gigabits/second.

You can click on Incoming Maps, Outgoing Maps, and Ratio at the bottom of the graph to view the statistics individually.

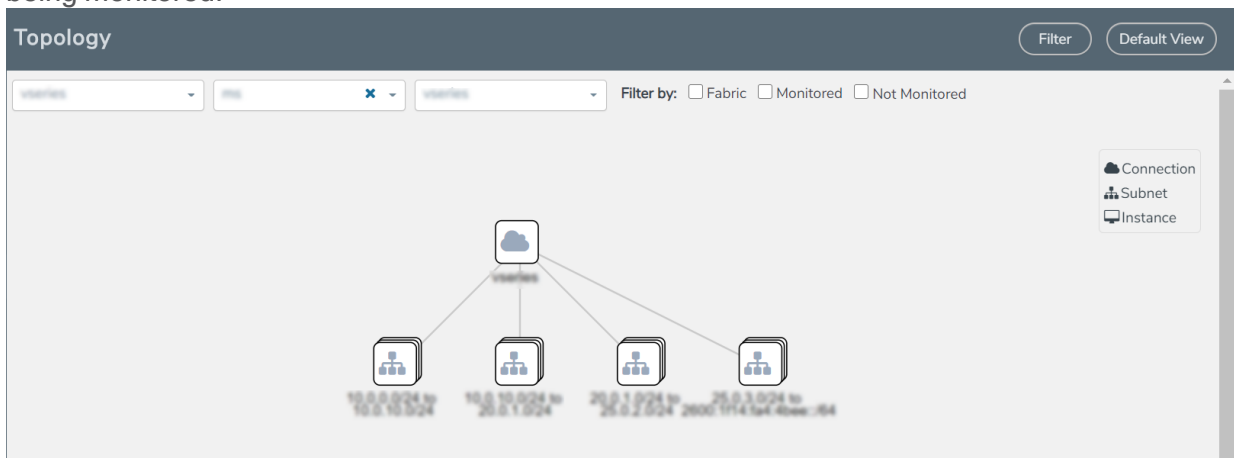

You can expand the **View Monitoring Session Diagram** and click on each individual map, application, and tunnel to view more details about the incoming and outgoing traffic on the selected statistics page. The Map Statistics page lets you choose the map rules to view the traffic matching the selected rule.

Visualize the Network Topology

Each connection can have multiple monitoring sessions configured within them. You can select the connection and the monitoring session to view the selected subnets and instances in the topology view.

To view the topology diagram:

1. From the left navigation pane, select **Traffic > VIRTUAL > Orchestrated Flows > AnyCloud**. The Monitoring Session page appears.
2. Select **Topology** tab.
3. Select a connection from the **Select connection...** list. The topology view of the subnets and instances is displayed.
4. (Optional) Select a monitoring session from the **Select Monitoring Session...** list. The topology view of the monitored subnets and instances in the selected session are displayed.
5. Select one of the following check boxes:
 - **Source:** Displays the topology view of the source target interfaces that are being monitored.
 - **Destination:** Displays the topology view of the destination target interfaces where the traffic is being mirrored.
 - **Other:** Displays the topology view of the VMs installed with G-vTAP Agents within the subnets being monitored.

6. (Optional) Hover over or click the subnet or VM Group icons to view the subnets or instances present within the group.

In the topology page, you can also do the following:

- Use the **Filter** button to filter the instances based on the VM name, VM IP, Subnet ID, or Subnet IP, and view the topology based on the search results.
- Use the **Default View** button to view the topology diagram based on the source interfaces of the monitoring instances.
- Use the arrows at the right-bottom corner to move the topology page up, down, left, or right. Click the **Fit-to-Width** icon to fit the topology diagram according to the width of the page.
- Use + or - icons to zoom in and zoom out the topology view.
