Universal Cloud Tap - Container

Universal Cloud Tap - Container (UCT-C) earlier known as Universal Container Tap (UCT) is a containerized component that provides the network broker features in a containerized form. UCT-C can perform traffic acquisition, basic filtering, and tunneling support. UCT-C is deployed as a Pod in the given worker node where the workloads are running.

The UCT-C is deployed by Kubernetes orchestrator and not by GigaVUE-FM. UCT-C initiates the traffic acquisition process with UCT-C Taps.

Following are the modules implemented in UCT-C:

- **Traffic Acquisition:** UCT-C supports traffic acquisition by replicating the traffic from the worker pods.
- **Filtering Module** - UCT-C provides basic filtering based on 5-Tuple. The filtering configuration is pushed by the GigaVUE-FM.
- **Tunneling Modules** - UCT-C supports L2GRE, VXLAN, and TLS-PCAPng tunneling to send the tapped traffic to the GigaVUE V Series Nodes or tools.

This guide provides an overview of Universal Cloud Tap - Container and describes how to install and deploy UCT-C components in your Pods.

Topics:

- [Architecture of Universal Cloud Tap - Container](#)
- [UCT-C and GigaVUE-FM Interaction](#)
- [Get Started with Universal Cloud Tap - Container](#)
- [Configure Universal Cloud Tap - Container](#)
- [Configure UCT-C Settings](#)
- [Precryption™](#)
- [Secure Tunnels](#)

Components of Universal Cloud Tap - Container

The Universal Cloud Tap - Container works with the following components:

- **GigaVUE-FM fabric manager** is a web-based fabric management and orchestration interface that provides a single pane of glass visibility, management, and orchestration of both the physical and virtual traffic that form the UCT-C.
- **UCT-C Tap** is the primary UCT-C module that collects the workload traffic, filters the traffic, and tunnels the filtered traffic directly to the tools or through the GigaVUE V Series Nodes. UCT-C Tap also sends the traffic policy statistics and heartbeats to UCT-C Controller. UCT-C Tap must run as a **privileged pod**.

NOTE: UCT-C uses eBPF (extended Berkeley Packet Filter) to tap traffic from user pods. eBPF runs on the Linux kernel and requires privileged pod permission in Kubernetes. UCT-C Tap pods require SYS_ADMIN and NET_ADMIN privileges to attach eBPF Hooks, run commands in other namespaces, and run low level networking commands.

- **UCT-C Controller** is the management component of UCT-C that controls and communicates with UCT-C Tap. UCT-C Controller collects the data from UCT-C Taps and sends the collected statistics and heartbeats to GigaVUE-FM.

Architecture of Universal Cloud Tap - Container

The following diagram illustrates the architecture of Universal Container Tap environment.

1. UCT-C Controller registers with GigaVUE-FM.
2. The UCT-C Tap is registered with GigaVUE-FM through the UCT-C Controller
3. GigaVUE-FM deploys the traffic policy on the UCT-Cs.
Communication of configuration, data, and statistics to and from UCT-C is performed through the UCT-C Controller Service. GigaVUE-FM communicates with the UCT-C Taps through the UCT-C Controller. GigaVUE-FM deploys the traffic policy on UCT-C and receives the statistics from UCT-C tap through UCT-C controller.
4. The filtered network packets are tunneled directly to the Tools or through the GigaVUE V Series nodes running on any supported GigaVUE Cloud Suite in the cloud environment.
5. The UCT-C Controller collects the data from UCT-C Taps and sends the collected statistics and heartbeats to GigaVUE-FM.

UCT-C and GigaVUE-FM Interaction

Following are the interactions between UCT-C and GigaVUE-FM:

- [UCT-C Registration](#)
- [UCT-C Deregistration](#)
- [UCT-C Heartbeats](#)
- [Monitoring Domain and Traffic Policy](#)

UCT-C Registration

When UCT-C comes up in the Kubernetes environment, UCT-C registers itself with GigaVUE-FM.

Check the network requirements for the registration to be successful. For more information, refer to [Network Firewall Requirements](#).

UCT-C only supports IPv4 protocol. For more information, refer to [Deploy UCT-C in Kubernetes](#).

UCT-C Deregistration

When UCT-C is terminated normally, UCT-C sends the deregistration message to GigaVUE-FM. If UCT-C goes down abnormally, it will get deregistered when the GigaVUE-FM misses to receive couple of heartbeats.

UCT-C Heartbeats

Periodically, UCT-C sends heartbeats to GigaVUE-FM. By default, the status of UCT-C is marked as **Connected**. The following are the various scenarios where the UCT-C status changes:

- If 3 consecutive heartbeats are missed, GigaVUE-FM marks the status as **Disconnected**.
- If 2 consecutive heartbeats are missed, GigaVUE-FM marks the status as **Pending**.
- GigaVUE-FM purges disconnected or terminated UCT-C taps after 30 days.

Monitoring Domain and Traffic Policy

You can configure and manage the Monitoring Domains, Connections, Source Inventories, and Traffic Policies of UCT-C in GigaVUE-FM. For more information, refer to [Configure UCT-C through GigaVUE-FM](#).

Refer to the [GigaVUE API Reference](#) for detailed information on the REST APIs of UCT-C.

- A Traffic Policy is a combination of Rules and Tunnels.
- A rule contains specific filtering criteria that the packets must match. The filtering criteria lets you determine the target instances and the (egress or ingress) direction of tapping the network traffic.
- A tunnel is a communication path in which the traffic matching the filtered criteria is routed to the destination.

Get Started with Universal Cloud Tap - Container

This section describes how to initiate UCT-C and GigaVUE-FM deployment with the required licenses and network requisites.

Refer to the following sections for details:

- [Pre-requisites of UCT-C](#)
- [Components of Universal Cloud Tap - Container](#)
- [License Information](#)
- [Network Firewall Requirements](#)
- [Compute Requirements](#)

Pre-requisites of UCT-C

The following are the pre-requisites of UCT-C:

- GigaVUE-FM and Kubernetes Cluster should be up and running.
- GigaVUE-FM and Kubernetes Cluster should be able to communicate with each other.
- To work with UCT-C, you must have knowledge of the following platforms and products:
 - a. Kubernetes
 - b. GigaVUE-FM
 - c. GigaVUE V Series
 - d. Knowledge of working in any platform, such as AWS EKS, Azure AKS, and RedHat OpenShift where the Kubernetes clusters are deployed.
- To deploy UCT-C using YAML files and Helm charts, ensure that you install the following:
 - Kubectl to deploy using YAML files
 - Helm to deploy using Helm charts (single and dual)

For more information on deployment of UCT-C Controller and Taps using the YAML files or the Helm Charts, refer to the following sections in [Deploy UCT-C Controller and Taps](#) topic:

- [Using YAML files](#)
- [Using Helm Charts](#)

NOTE: Traffic can be terminated directly to the tool or can be directed to GigaVUE V Series node, where it can be filtered before sending to the tool.

Refer to the following topics for more detailed information:

- [License Information](#)
- [Network Firewall Requirements](#)
- [Compute Requirements](#)
- [Kernel and CPU Requirements for Universal Cloud Tap - Container](#)
- [Supported Platforms for UCT-C](#)

License Information

All the UCT-C Taps deployed in your environment periodically report the statistics to UCT-C Controller. Then, the UCT-C Controller periodically reports the collective statistics of UCT-C Taps to GigaVUE-FM for Volume-Based Licensing.

In the Volume-Based Licensing scheme, a license entitles specific applications on your devices to use a specified amount of total data volume over the term of the license. The license distribution to individual nodes or devices becomes irrelevant for Gigamon accounting purpose. GigaVUE-FM tracks the total amount of data processed by the UCT-C and the overuse, if any.

Volume-based licensing has a service period of 1 month. Service period is the period of time for which the total usage or overage is tracked. There is a grace period for each license that is encoded in the license file. The license effectively provides data allowance for this additional time after the official end time of the license.

To purchase licenses with the Volume-Based License (VBL) option, contact our Sales. Refer to [Contact Sales](#) for more details.

Network Firewall Requirements

The following table lists the Network Firewall / Security Group requirements for GigaVUE Cloud Suite.

NOTE: When using dual stack network, the below mentioned ports must be opened for both IPv4 and IPv6.

Direction	Protocol	Port	CIDR	Purpose
GigaVUE-FM				
Inbound	TCP	443	Administrator Subnet	Allows GigaVUE-FM to accept Management connection using REST API. Allows users to access GigaVUE-FM UI securely through HTTPS connection.
Inbound	TCP	22	Administrator Subnet	Allows CLI access to user-initiated management and diagnostics.
Inbound (This is the port used for Third Party Orchestration)	TCP	443	UCT-V Controller IP	Allows GigaVUE-FM to receive registration requests from UCT-V Controller using REST API.
Inbound (This is the port used for Third Party Orchestration)	TCP	443	GigaVUE V Series Node IP	Allows GigaVUE-FM to receive registration requests from GigaVUE V Series Node using REST API when GigaVUE V Series Proxy is not used.

Direction	Protocol	Port	CIDR	Purpose
Inbound (This is the port used for Third Party Orchestration)	TCP	443	GigaVUE V Series Proxy IP	Allows GigaVUE-FM to receive registration requests from GigaVUE V Series Proxy using REST API.
Inbound	TCP	5671	GigaVUE V Series Node IP	Allows GigaVUE-FM to receive traffic health updates from GigaVUE V Series Nodes.
Inbound	TCP	5671	UCT-V or Subnet IP	Allows GigaVUE-FM to receive statistics from Next Generation UCT-V.
Inbound	UDP	2056	GigaVUE V Series Node IP	Allows GigaVUE-FM to receive Application Intelligence and Application Visualization reports from GigaVUE V Series Node.
Outbound	TCP	9900	GigaVUE-FM IP	Allows GigaVUE-FM to communicate control and management plane traffic with UCT-V Controller
Outbound (optional)	TCP	8890	GigaVUE V Series Proxy IP	Allows GigaVUE-FM to communicate control and management plane traffic to GigaVUE V Series Proxy
Outbound	TCP	8889	GigaVUE V Series Node IP	Allows GigaVUE-FM to communicate control and management plane traffic to GigaVUE V Series Node
Outbound	TCP	443	Any IP Address	Allows GigaVUE-FM to reach the Public Cloud Platform APIs.
UCT-V Controller				
Inbound	TCP	9900	GigaVUE-FM IP	Allows UCT-V Controller to communicate control and management plane traffic with GigaVUE-FM
Inbound (This is the port used for Third Party Orchestration)	TCP	8891	UCT-V or Subnet IP	Allows UCT-V Controller to receive the registration requests from UCT-V.
Inbound	TCP	22	Administrator Subnet	Allows CLI access for user-initiated management and diagnostics, specifically when using third party

Direction	Protocol	Port	CIDR	Purpose
				orchestration.
Outbound (This is the port used for Third Party Orchestration)	TCP	443	GigaVUE-FM IP	Allows UCT-V Controller to send the registration requests to GigaVUE-FM using REST API.
Outbound	TCP	9901	UCT-V Controller IP	Allows UCT-V Controller to communicate control and management plane traffic with UCT-Vs.
Outbound	TCP	5671	GigaVUE-FM IP	Allows UCT-V Controller to send traffic health updates to GigaVUE-FM.
UCT-V				
Inbound	TCP	9901	UCT-V Controller IP	Allows UCT-V to receive control and management plane traffic from UCT-V Controller
Outbound (This is the port used for Third Party Orchestration)	TCP	8891	UCT-V Subnet IP	Allows UCT-V to communicate with UCT-V Controller for registration and Heartbeat
Outbound	UDP (VXLAN)	VXLAN (default 4789)	UCT-V Subnet IP	Allows UCT-V to tunnel VXLAN traffic to GigaVUE V Series Nodes
Outbound	IP Protocol (L2GRE)	VXLAN (default 4789)	UCT-V Subnet IP	Allows UCT-V to tunnel L2GRE traffic to GigaVUE V Series Nodes
Outbound (Optional - This port is used only for Secure Tunnels)	TCP	11443	UCT-V subnet	Allows UCT-V to securely transfer the traffic to the GigaVUE V Series Node
Outbound	TCP	9900	UCT-V Controller IP	Allows UCT-V to send traffic health updates to UCT-V Controller.
GigaVUE V Series Proxy (optional)				
Inbound	TCP	8890	GigaVUE-FM IP	Allows GigaVUE-FM to communicate control and management plane traffic with GigaVUE V Series Proxy.
Inbound	TCP	8891	GigaVUE V	Allows GigaVUE V Series

Direction	Protocol	Port	CIDR	Purpose
(This is the port used for Third Party Orchestration)			Series Node IP	Proxy to receive registration requests and heartbeat messages from GigaVUE V Series Node.
Inbound	TCP	22	Administrator Subnet	Allows CLI access for user-initiated management and diagnostics, specifically when using third party orchestration.
Outbound	TCP	443	GigaVUE-FM IP	Allows GigaVUE V Series Proxy to communicate the registration requests to GigaVUE-FM
Outbound	TCP	8889	GigaVUE V Series Node IP	Allows GigaVUE V Series Proxy to communicate control and management plane traffic with GigaVUE V Series Node
GigaVUE V Series Node				
Inbound	TCP	8889	GigaVUE-FM IP	Allows GigaVUE V Series Node to communicate control and management plane traffic with GigaVUE-FM
Inbound	TCP	8889	GigaVUE V Series Proxy IP	Allows GigaVUE V Series Node to communicate control and management plane traffic with GigaVUE V Series Proxy.
Inbound	UDP (VXLAN)	VXLAN (default 4789)	UCT-V Subnet IP	Allows GigaVUE V Series Nodes to receive VXLAN tunnel traffic to UCT-V
Inbound	IP Protocol (L2GRE)	L2GRE	UCT-V Subnet IP	Allows GigaVUE V Series Nodes to receive L2GRE tunnel traffic to UCT-V
Inbound	UDPGRE	4754	Ingress Tunnel	Allows GigaVUE V Series Node to receive tunnel traffic from UDPGRE Tunnel
Inbound	TCP	22	Administrator Subnet	Allows CLI access for user-initiated management and diagnostics, specifically when using third party orchestration.
Inbound (Optional - This	TCP	11443	UCT-V subnet	Allows to securely transfer the traffic to GigaVUE V Series Nodes.

Direction	Protocol	Port	CIDR	Purpose
port is used only for Secure Tunnels)				
Outbound	TCP	5671	GigaVUE-FM IP	Allows GigaVUE V Series Node to send traffic health updates to GigaVUE-FM.
Outbound	UDP (VXLAN)	VXLAN (default 4789)	Tool IP	Allows GigaVUE V Series Node to tunnel output to the tool.
Outbound	IP Protocol (L2GRE)	VXLAN (default 4789)	Tool IP	Allows GigaVUE V Series Node to tunnel output to the tool.
Outbound	UDP	2056	GigaVUE-FM IP	Allows GigaVUE V Series Node to send Application Intelligence and Application Visualization reports to GigaVUE-FM.
Outbound	UDP	2055	Tool IP	Allows GigaVUE V Series Node to send NetFlow traffic to an external tool.
Outbound	UDP	514	Tool IP	Allows GigaVUE V Series Node to send Application Metadata Intelligence log messages to external tools.
Bidirectional (optional)	ICMP	<ul style="list-style-type: none"> ● echo request ● echo reply 	Tool IP	Allows GigaVUE V Series Node to send health check tunnel destination traffic.
Outbound (This is the port used for Third Party Orchestration)	TCP	8891	GigaVUE V Series Proxy IP	Allows GigaVUE V Series Node to send registration requests and heartbeat messages to GigaVUE V Series Proxy when GigaVUE V Series Proxy is used.
Outbound (This is the port used for Third Party Orchestration)	TCP	443	GigaVUE-FM IP	Allows GigaVUE V Series Node to send registration requests and heartbeat messages to GigaVUE-FM when GigaVUE V Series Proxy is not used.
Outbound (Optional - This port is used only for Secure Tunnels)	TCP	11443	Tool IP	Allows to securely transfer the traffic to an external tool.
Universal Cloud Tap - Container deployed inside Kubernetes worker node				
Outbound	TCP	42042	Any IP address	Allows UCT-C to send

Direction	Protocol	Port	CIDR	Purpose
				statistics information to UCT-C Controller.
Outbound	UDP	VXLAN (default 4789)	Any IP address	Allows UCT-C to tunnel traffic to the GigaVUE V Series Node or other destination.
UCT-C Controller deployed inside Kubernetes worker node				
Inbound	TCP	8443 (configurable)	Load Balancer IP Address	Allows GigaVUE-FM to communicate with UCT-C Controller.
Outbound	TCP	5671	Any IP address	Allows UCT-C Controller to send statistics to GigaVUE-FM.
Outbound	TCP	443	GigaVUE-FM IP address	Allows UCT-C Controller to communicate with GigaVUE-FM.

The following table describes the ports that should be opened on GigaVUE-FM:

Direction	Port	Purpose
Inbound	443	GigaVUE-FM REST service port.
Outbound	4433	Allows GigaVUE-FM to communicate with UCT-C Controller.
Outbound	8443	Allows GigaVUE-FM to communicate with UCT-C Controller.
Inbound	5671	Allows UCT-C to send statistics to GigaVUE-FM through Rabbit-MQ port.

Compute Requirements

The following table describes the minimum compute network requirements for UCT-C.

Compute Instances	vCPU	Memory	Disk Space
UCT-C Controller	1 vCPU	refer to the table below	—
UCT-C Tap	1 vCPU	1GB	—
GigaVUE V Series Node	4 vCPUs	8GB	20GB
GigaVUE V Series Proxy	1 vCPU	1GB	2GB
GigaVUE-FM	4 vCPUs	16GB	41GB

Compute Instances	Memory	Cluster Size
UCT-C Controller	256MB	less than 1000 pods
UCT-C Controller	512MB	2000 pods
UCT-C Controller	1GB	up to 3000 pods

Kernel and CPU Requirements for Universal Cloud Tap - Container

The kernel requirements for different platforms are as follows:

- EKS – 5.4
- Native Kubernetes– 5.4, 4.19 (Photon+ OS)

The minimum CPU and RAM requirements for TAP and Controller are as follows:

- UCT-C - 1vcpu and 64Mi
- UCT-C - Controller- 1vcpu and 64Mi

Supported Platforms for UCT-C

The following tables list the different platforms and their Kubernetes version, Container Run-time Interface (CRI), and Container Network Interface (CNI) that are qualified and supported for UCT-C(GKE Version 1.23).

NOTE: As an end user, you must have an understanding and knowledge of your container services.

Platform	Kubernetes Version	CRI	CNI
Amazon Elastic Kubernetes Service (EKS)	1.26	Containerd	VPC
Azure Kubernetes Service (AKS)	1.24	Containerd	Azure CNI
VMware Tanzu	1.20	Containerd	Antrea and Calico
Red Hat OpenShift	1.22	CRI-O	OVN
Native Kubernetes	1.26, 1.28, 1.29	Containerd	Flannel, Cilium, and Calico

Configure Universal Cloud Tap - Container

Setting up UCT-C involves the following two steps:

- [Deploy UCT-C in Kubernetes](#)
- [Configure UCT-C through GigaVUE-FM](#)

The Red Hat supported base images of the UCT-C applications are built on the top of Red Hat Universal Base Image or Red Hat Enterprise Linux Image. The UCT-C images are **Red Hat Certified** for Red Hat OpenShift platform.

Create Secret to pull UCT-C image

To create secret, follow these steps:

1. UCT-C Controller and Tap images will be available for each and every release build in the Gigamon software portal. Download the respective UCT-C release build from the repository and untar the file. After you finish untarring the file, you can extract the images and import them to your repository.

NOTE: [Contact Technical Support](#) or [Contact Sales](#) for information on downloading the respective UCT-C build from the Gigamon software portal.

2. Get the **username/key/password** from support team and encode using the command:

```
echo -n <<user name>>:<<keys>> | base64
```

3. Update the keys in the following content and save it as a JSON file:

```
{
  "auths": {
    "https://index.docker.io/v1/": {
      "auth": "<<keys>>"
    }
  }
}
```

4. Create secret using the following command (regcred is used as name of the secret in this doc):

```
kubectl create secret generic <<name of the secret>> --from-
file=.dockerconfigjson=<<json file path >>
--type=kubernetes.io/dockerconfigjson -n <<namespace where UCT-C Controller
and tap will be deployed>>
```

Deploy UCT-C in Kubernetes

To fully deploy UCT-C, the following steps are required to be completed:

1. Implement external access to the Kubernetes environment (e.g., ingress, external public IPs, load balancers) to allow communication between the UCT-C Controller and GigaVUE-FM.
2. Ensure that the firewall rules on Kubernetes nodes are met according to the [Network Firewall Requirements](#).
3. YAML files or HELM charts are available as part of the UCT-C images. You should untar the UCT-C image to access the readme files.
4. Add the UCT-C images to a private Docker registry or ensure that the files can be pulled from the Docker Hub registry. You can spin up or spin down the UCT-C instances based on your traffic load.
5. Deploy UCT-C Controller and Taps using YAML files or Helm Charts. Refer to [Deploy UCT-C Controller and Taps](#).

Deploy UCT-C Controller and Taps

You can deploy the UCT-C Controller and Taps using the YAML files or the Helm Charts. Refer to the following sections for detailed information.

- [Using YAML files](#)
- [Using Helm Charts](#)

Using YAML files

Starting from software version 6.4.00, YAML files will be available for each and every release build in the Gigamon software portal. Download the respective UCT-C release build from the repository and untar the **.tgz** file. After you finish untarring the file, you can extract the YAML file and further update the following fields in **uctc-controller.yaml** and **uctc-tap.yaml** file.

NOTE: [Contact Technical Support](#) or [Contact Sales](#) for information on downloading the respective UCT-C build from the Gigamon software portal.

Deployment of UCT-C Controller

Follow these steps to deploy the UCT-C Controller:

- Use the below command to Unzip and Untar the .tgz file:

```
gunzip <name of the UCT-C Controller .tgz file>  
tar -xvf <name of the UCT-C Controller .tar file>
```

After extracting the tar file, navigate to the YAML folder in the newly created **uctc-cntlr-<image version>-<build number>** folder and update the details given in the below steps.

- Provide the created **secret** in the following section of the YAML file:

```
imagePullSecrets:
  - name: <secret>
```

- Provide the **FM IP address** in the following section of the YAML file:

```
command:
  - /uct-controller
  - <FM IPv4 or FM IPv6 or FM IPv4,FM IPv6(both with comma-separation notation)>
  - '443'
  - '8443'
  - '0'
  - "/etc/gcbcerts"
  - "gcb-cert.pem"
  - "gcb-pvt-key.pem"
  - "gcb-ca-root-cert.pem"
```

Refer to the below examples:

```
# example1: 192.168.0.10 (IPv4)
# example2: 2001:db8:abcd:ef01::5 (IPv6)
# example3: 192.168.0.10,2001:db8:abcd:ef01::5 (IPv4,IPv6)
```

- If you provide both IPv4 and IPv6 addresses in the above argument, the following configurations will be used:

```
- name: UCTC_CNTLR_FM_IP_CONFIG
value: IPv4 or IPv6
- name: UCTC_CNTLR_FALLBACK_CONFIG
value: True or False
```

IP CONFIG option allows the user to provide the preferred IP version. If the user does not provide any value, the default value IPv4 will be used.

When the preferred IP version fails to connect (example: IPv6), **FALLBACK CONFIG** will be used to connect to the other available IP version (example: IPv4). Default value True will be used to consider the Fallback mechanism.

Note

- Fallback configuration will be used during node registration phase only.
- Controller FM IP and FALLBACK configurations will be used only if you provide both IPv4 and IPv6.
- If you provide IPv4 alone, only IPv4 connections will be considered, and UCTC_CNTLR_FM_IP_CONFIG and UCTC_CNTLR_FALLBACK_CONFIG will be disregarded. Similarly, if IPv6 alone is provided, only IPv6 connections will be considered.
- Default values will be used if you do not provide any options.

**Note**

In dual stack cluster, update the following fields in **uctc-cntlr-service** to deploy dual stack setup.

```
Spec:
  ipFamilies:
  - Ipv4
  - IPv6
  ipFamilyPolicy: PreferDualStack
```

- Provide **External IP** and **Kubernetes Cluster API URL** in the following section of the YAML file:

```
env:
- name: UCTC_CNTLR_SERVICE_NAME
  value: "GIGAMON_UCTC_CNTLR_SERVICE"
- name: UCTC_CNTLR_EXT_IP_DNS
  value: "<external IPv4 or external IPv6 or external IPv4,IPv6 (both with
  comma-separation notation) or DNS"
```

Refer to the below examples:

```
# example1: 192.168.0.10 (IPv4)
# example2: 2001:db8:abcd:ef01::5 (IPv6)
# example3: 192.168.0.10,2001:db8:abcd:ef01::5 (IPv4,IPv6)
# example4: gigamon.example.com
- name: K8S_CLUSTER_ENDPOINT
  value: <K8s Cluster API URL>
```

Refer to the below example:

```
# example: https://10.10.10.13:6443
- name: FM_FQDN
  value: www.fm.gigamon.com
```

- Update the namespace in the YAML file as required and run the following command:

```
kubectl create -f uctc-controller.yaml
```

Following the execution of the above command, when UCT-C Controller pod is created successfully, the output (sample) will be as below:

```
gigamon@controller-2:~$kubectl create -f uctc-controller.yaml
service/gigamon-uctc-cntlr-service created
deployment.apps/uctc-cntlr-v1 created
clusterrole.rbac.authorization.k8s.io/pods-list created
clusterrolebinding.rbac.authorization.k8s.io/pods-list created
```

Deployment of UCT-C Tap

Follow these steps to deploy the UCT-C Tap:

- Use the below command to Unzip and Untar the .tgz file:

```
gunzip <name of the UCT-C Tap .tgz file>
tar -xvf <name of the UCT-C Tap .tar file>
```

After extracting the tar file, navigate to the YAML folder in the newly created **uctc-tap-<image version>-<build number>** folder and update the details given in the below steps.

- Feed the created **secret** in the below section of YAML file

```
imagePullSecrets:
- name: <secret>
```

- Update the namespace in the below section of YAML file as required. This should be same as the namespace in which UCT-C controller is deployed.

```
- name: UCTC_CNTRLR_SVC_DNS
value: gigamon-uctc-cntlr-service.<namespace>.svc.cluster.local
```

- When UCT-C TAP gets both IPv4 and IPv6 from the above controller service DNS, the following configurations will be used:

```
- name: UCTC_TAP_IP_CONFIG
value: IPv4 or IPv6
- name: UCTC_TAP_FALLBACK_CONFIG
value: True or False
```

IP CONFIG option allows the user to provide the preferred IP version. If the user does not provide any value, the default value IPv4 will be used.

When the preferred IP version fails to connect (example: IPv6), the **FALLBACK CONFIG** will be used to connect to the other available IP version (example: IPv4). Default value True will be used to consider the Fallback mechanism.

Note

- Fallback configuration will be considered during node registration only.
- If IPv4 alone is provided, only IPv4 connections will be considered, and UCTC_TAP_IP_CONFIG and UCTC_TAP_FALLBACK_CONFIG will be disregarded. Similarly, if IPv6 alone is provided, only IPv6 connections will be considered.
- Default values will be used if TAP gets dual IP's from the controller service DNS.

- Edit the following **volumeMounts** as per your container Runtime.

```
volumeMounts:
- name: socket
  mountPath: /var/run/containerd/containerd.sock

volumes:
- name: socket
  hostPath:
    Path: /var/run/containerd/containerd.sock
```

Below are the socket location for commonly used CRIs,

```
docker - /var/run/docker.sock
```

```
containerd - /var/run/containerd/containerd.sock
cri-o - /var/run/crio/crio.sock
```

- o Run the following command for deploying UCT-C Tap:

```
kubectl create -f uctc-tap.yaml -n <namespace where UCT-C tap has to be deployed>
```

Following the execution of the above command, when UCT-C Tap pod is created successfully, the output (sample) will be as below:

```
gigamon@controller-2:~$ kubectl create -f uctc-tap.yaml -n uctc
daemonset.apps/gigamon-uctc created
```

The following table gives a description of all the field values in the YAML file that are updated:

Field Values	Description
Port: 443	The UCT-C Controller REST service port number.
Port: 42042	This port must be port 42042. Allows UCT-C to send statistics information to UCT-C Controller.
GigaVUE-FM IP	The IP address of the GigaVUE-FM with which your UCT-C is connected.
UCT-C-Cntrl REST SVC Port	The UCT-C Controller REST service port number. This must be opened on your GigaVUE-FM to allow inbound traffic to Kubernetes. This allows GigaVUE-FM to communicate with UCT-C Controller. Example: 8443 (configurable)
FM REST Svc Port	The GigaVUE-FM REST service port number. This must be opened on your Kubernetes to allow outbound traffic. This allows UCT-C Controller to communicate with GigaVUE-FM. Example: 443
Ports: containerPort: 443 containerPort: 42042	Two ports must be opened. The first container port must be the same as UCT-C-Cntrl REST SVC Port. The second container port must be port 42042. This allows UCT-C to send statistical data to UCT-C controller.
External LB balancer IP	The external load balancer IP/DNS value to allow GigaVUE-FM to communicate with UCT-C Controller within Kubernetes.
K8S cluster end-point	Kubernetes cluster end point for GigaVUE-FM to access the control plane. Example: https://<kubernetesapiserverurl>:6443

Using Helm Charts

Starting from software version 6.4.00, Helm Charts will be available for each and every release build in the Gigamon software portal. Download the respective UCT-C release build from the repository and untar the **.tgz** file. After you finish untarring the file, you can extract the Helm Charts (**uct-cntrl-<version>.tgz** and **uct-tap-<version>.tgz**) and further update the following fields before deployment.

NOTE: [Contact Technical Support](#) or [Contact Sales](#) for information on downloading the respective UCT-C build from the Gigamon software portal.

Refer to the following sections for detailed information.

- [Deploy using Single Helm Chart](#)
- [Deploy using Two Helm Charts](#)

NOTE: Support for two Helm Charts is deprecated from software version 6.7.00 and will be removed from the deliverables from software version 6.8.00.

Deploy using Single Helm Chart

Starting from software version 6.6.00, you can deploy UCT-C Controller and Taps using single Helm Chart. Follow the steps listed below to deploy the solution.

- Use the below command to Unzip and Untar the .tgz file:

```
gunzip <name of the UCT-C .tgz file>
tar -xvf <name of the UCT-C .tar file>
```

After extracting the tar file, navigate to the Helm folder in the newly created **uctc-
<image version>-<build number>** folder and update the details given in the below steps.

- Update the **imagePullSecrets, namespace, GigaVUE-FM IP, external load balancer IP** and **Kubernetes API URL** in the following section of the **values.yaml file** present in the UCT-C directory.

```
imagePullSecrets: [{name: secret}]
namespace: uctc
```

If you provide IPv4 alone and not IPv6, then GigaVUE-FM will consider only IPv4 address for communication.

```
fm_ip: "<FM IPv4>"
```

If you provide IPv6 alone and not fm_ip, then GigaVUE-FM will consider only IPv6 address for communication.

```
fm_ipv6: "<FM IPv6>"
```

If both IPv4 and IPv6 are provided, **UCTC_CNTLR_FM_IP_CONFIG** will be used to choose the preferred IP stack.

```
ext_load_balancer: "<FM IPv4 or FM IPv6 or FM IPv4,FM IPv6(both with comma-  
separation notation>"
```

Refer to the below examples:

```
# example1: 192.168.0.10 (IPv4)
# example2: 2001:db8:abcd:ef01::5 (IPv6)
# example3: 192.168.0.10,2001:db8:abcd:ef01::5 (IPv4,IPv6)
k8s_cluster_url: "<url>"
```

```
# example: https://10.10.10.12:6443
```

- If you provide two IP's, IPv4 and IPv6 in the `fm_ip` argument, the following configurations will be used:

```
# values: <IPv4 | IPv6>
uctc_tap_ip_config: "IPv4"
# values: <true | false>
uctc_tap_fallback_config: "false"
```

IP CONFIG option allows the user to provide the preferred IP version. If the user does not provide any value, the default value IPv4 will be used.

When the preferred IP version fails to connect (example: IPv6), the **FALLBACK CONFIG** will be used to connect to the other available IP version (example: IPv4). Default value True will be used to consider the Fallback mechanism.

Note

- Fallback configuration will be used during node registration phase only.
- Controller FM IP and FALLBACK configurations will be used only if you provide both IPv4 and IPv6.
- Default values will be used if you do not provide any options.

- Edit the following **volumeMounts** as per your container Runtime:

```
crisocketvolume:
  mountPath: /var/run/containerd/containerd.sock
  name: socket
```

The socket location for commonly used CRIs are as follows:

```
docker - /var/run/docker.sock
containerd - /var/run/containerd/containerd.sock
cri-o - /var/run/crio/crio.sock
```

- Run the below command in the location where UCT-C folder is present.

```
helm install uctc ./uctc -n <Namespace>
```
- Run the below command to validate the deployment and check for any failures.

```
helm test uctc
```

Deploy using Two Helm Charts

Deployment of UCT-C Controller

- Use the below command to Unzip and Untar the .tgz file:

```
gunzip <name of the UCT-C Controller .tgz file>
tar -xvf <name of the UCT-C Controller .tar file>
```

After extracting the tar file, navigate to the Helm folder in the newly created **uctc-cntlr-<image version>-<build number>** folder and update the details given in the below steps.

- Update the **imagePullSecrets, namespace, GigaVUE-FM IP, external load balancer IP** and **Kubernetes API URL** in the following section of the **values.yaml** file present in UCT-C-cntlr directory.

```
imagePullSecrets: [{name: secret}]
namespace: uctc
fm_ip: "<FM IPv4 or FM IPv6 or FM IPv4,FM IPv6(both with comma-separation notation>"
ext_load_balancer: "<FM IPv4 or FM IPv6 or FM IPv4,FM IPv6(both with comma-separation notation>"
Refer to the below examples:
# example1: 192.168.0.10 (IPv4)
# example2: 2001:db8:abcd:ef01::5 (IPv6)
# example3: 192.168.0.10,2001:db8:abcd:ef01::5 (IPv4,IPv6)
k8s_cluster_url: "<url>"
# example: https://10.10.10.12:6443
```

- If you provide both IPv4 and IPv6 addresses in the `fm_ip` argument, the following configurations will be used:

```
- name: UCTC_CNTLR_FM_IP_CONFIG
value: IPv4 or IPv6
- name: UCTC_CNTLR_FALLBACK_CONFIG
value: True or False
```

IP CONFIG option allows the user to provide the preferred IP version. If the user does not provide any value, the default value IPv4 will be used.

When the preferred IP version fails to connect (example: IPv6), the **FALLBACK CONFIG** will be used to connect to the other available IP version (example: IPv4). Default value True will be used to consider the Fallback mechanism.

Note

- Fallback configuration will be used during node registration phase only.
- Controller FM IP and FALLBACK configurations will be used only if you provide both IPv4 and IPv6.
- If you provide IPv4 alone, only IPv4 connections will be considered, and UCTC_CNTLR_FM_IP_CONFIG and UCTC_CNTLR_FALLBACK_CONFIG will be disregarded.
- Default values will be used if you do not provide any options.

- Run the below command in the location where UCT-C-cntlr folder is present to bring up UCT-C Controller.

```
helm install uctc-cntlr ./uctc-cntlr -n <Namespace>
```

Following the execution of the above command, when UCT-C Controller pod is created successfully, the output (sample) will be as below:

```
gigamon@controller-2:~$ helm install uctc-cntlr ./uctc-cntlr -n uctc
NAME: uctc-cntlr
```

```
LAST DEPLOYED: Sat Feb 3 13:11:11 2024
NAMESPACE: uctc
STATUS: deployed
REVISION: 1
TEST SUITE: None
```

- In dual stack cluster, update the following fields in **uctc-cntlr-service** to deploy dual stack setup.

```
Spec:
ipFamilies:
- Ipv4
- IPv6
ipFamilyPolicy: PreferDualStack
```

Deployment of UCT-C Tap

- Use the below command to Unzip and Untar the .tgz file:

```
gunzip <name of the UCT-C Tap .tgz file>
tar -xvf <name of the UCT-C Tap .tar file>
```

After extracting the tar file, navigate to the Helm folder in the newly created **uctc-tap-<image version>-<build number>** folder and update the details given in the below steps.

- Update the **imagePullSecrets, namespace** in the following section of **values.yaml** file present in UCT-C-tap directory. This should be same as the namespace in which UCT-C- Controller is deployed.

```
imagePullSecrets: [{name: secret}]
namespace: uctc
```

- If you provide IPv6 address alone in the fm_ip argument, the following configuration will be used.

```
- name: UCTC_TAP_IP_CONFIG
value: 'IPv6'
```

- If you provide both IPv4 and IPv6 addresses in the fm_ip argument, the following configurations will be used:

```
- name: UCTC_TAP_IP_CONFIG
value: IPv4 or IPv6
- name: UCTC_TAP_FALLBACK_CONFIG
value: True or False
```

IP CONFIG option allows the user to provide the preferred IP version. If the user does not provide any value, the default value IPv4 will be used.

When the preferred IP version fails to connect (example: IPv6), the **FALLBACK CONFIG** will be used to connect to the other available IP version (example: IPv4). Default value True will be used to consider the Fallback mechanism.

- Edit the following **volumeMounts** as per your container Runtime:

```
crisocketvolume:  
  mountPath: /var/run/containerd/containerd.sock  
  name: socket
```

The socket location for commonly used CRIs are as follows:

```
docker - /var/run/docker.sock  
containerd - /var/run/containerd/containerd.sock  
cri-o - /var/run/crio/crio.sock
```

- Run the below command in the location where UCT-C-tap directory is present to bring up UCT-C Tap.

```
helm install uctc-tap ./uctc-tap -n <namespace>
```

Following the execution of the above command, when UCT-C Tap pod is created successfully, the output (sample) will be as below:

```
gigamon@controller-2:~$ helm install uctc-tap ./uctc-tap -n uctc  
NAME: uctc-tap  
LAST DEPLOYED: Sat Feb 3 13:11:14 2024  
NAMESPACE: uctc  
STATUS: deployed  
REVISION: 1  
TEST SUITE: None
```

Configure UCT-C through GigaVUE-FM

This section describes how to configure UCT-C through GigaVUE-FM GUI. Refer to the following section for details.

- [Launch GigaVUE-FM](#)
- [Create Monitoring Domain](#)
- [Create Source Selectors](#)
- [Create Tunnel Specifications](#)
- [Configure Traffic Policy](#)
- [Traffic Policy Statistics](#)

Launch GigaVUE-FM

The recent GigaVUE-FM image files can be downloaded from the [Gigamon Customer Portal](#). After fetching the image, upload and launch GigaVUE-FM on your GigaVUE V Series Node supported cloud environment. For assistance, [Contact Technical Support](#) of Gigamon or refer to GigaVUE Cloud Suite for more information on GigaVUE V Series configuration on the supported cloud environments.

Create Monitoring Domain

To create a monitoring domain in GigaVUE-FM:

1. In GigaVUE-FM, on the left navigation pane, select **Inventory > CONTAINER > Universal Cloud Tap - Container > Monitoring Domains**. The **Monitoring Domain** page appears.
2. In the **Monitoring Domain** page, click **New**. The **New Monitoring Domain** wizard appears.
3. Enter or select the required information as described in the following table.

Fields	Description
Monitoring Domain Name	Enter a name for the monitoring domain
Connections	
Connection Name	Enter a name for the UCT-C connection
Cluster Name	Enter a name for the cluster
URL	Enter the URL of the API server

Click  to add another connection and click  to remove an existing connection.

4. Click **Save** to create a monitoring domain.

NOTE: If the connecting UCT-C Tap does not send 3 continuous heart beats, it is marked as disconnected and it is shown on the monitoring domain page as per the interval configured in the UCT-C Purge (the default purge interval is 30 days) before the GigaVUE-FM cleans them up.

You can view the monitoring domain created in the list view. The list view shows the following information for UCT-C and controllers:

- Monitoring Domain
- URL
- Connection
- Cluster Name
- Cluster Version
- Controller / TAP
- UCT-C UUID
- Management IP
- Version
- Node Name
- Node Kernel Version

- Status -If you enable Secure Tunnel, its status can be viewed in Monitoring Domain page.
- Discovered Sources

NOTE: You need to refresh pages manually in UCT-C Monitoring Domain and Policy Page as the automatic GUI refresh is disabled.

Use the following buttons to manage your Monitoring Domain:

Button	Description
New	Use to create new connection
Actions	Provides the following options: <ul style="list-style-type: none"> ▪ Edit- Edit the monitoring domain ▪ Delete Domain - Delete the monitoring domain
Filter	Filters the monitoring domain based on the following options: <ul style="list-style-type: none"> ▪ Connected ▪ Pending ▪ Disconnected ▪ Terminated

 **Notes:**

- You can click on the **Discovered Sources** link to view the source details. In the Discovered Sources window, you can enable the **Show System Pods** button to view the information related to the system pods that are not monitored.
- Gigamon cannot tap traffic if hostnetworks are set to true in pods.

Create Source Selectors

When setting up a traffic flow, it is important to define the selection criteria for the sources of traffic. Use the Source Selectors page for configuring the sources of the traffic to be monitored.

To configure the Source Selectors:

1. Select **Inventory > Resources> Source Selectors**.
2. On the **Source Selectors** page, navigate to the **Container** tab and click **Create**. The **New Source Selector** wizard appears.

3. Enter or select the required information:

Field	Action
Name	Enter a name for the source
Include Filters (Criteria 1)	
You can select any one of the following options	
<ul style="list-style-type: none"> ● All Sources - Select this option to acquire traffic from all names, all pods and containers within the selected cluster(s). Depending on the size of the cluster(s), volume of traffic may be larger. ● Criteria1- You must enter the following options: 	
Object Property	Select an object property to filter the traffic source.
Operator	Select the operator.
Values	Enter the values for the filter. Values are case-sensitive.
<p>On the Criteria, click  to add another Object and click  to remove an existing Object.</p>	
Exclude Filters (Criteria 1)	
On the Criteria, click  to add another Object and click  to remove an existing Object.	
Object Property	Select an object property to filter the traffic source.
Operator	Select any one of the operators: <ul style="list-style-type: none"> ● equals ● contains ● startswith ● endwith
Values	Enter the values for the filter. Values are case-sensitive.

On the Include or Exclude filters, click  to add another Criteria and click  to remove an existing Criteria.

4. Click **Save** to save the filter.

Notes: You can create multiple filter criteria. Within each criterion, you can configure multiple filters.

- If you have configured multiple filters in a criterion, then the traffic will be filtered only if all the filter rules are true.
- If you have configured multiple criteria, then the traffic will be filtered even if one of the criteria is true.

Create Tunnel Specifications

A tunnel of type L2GRE, VXLAN, or TLS-PCAPNG can be created. The tunnel is an egress tunnel. For more information to create a tunnel of type TLS-PCAPNG, refer to [Secure Tunnels](#) . [Secure Tunnels](#)

To configure the tunnels:

1. Select **Inventory > Resources > Tunnel Specifications**.
2. On the **Tunnel Specifications** page, navigate to **Container** tab and click **Create**. The **Create Tunnel Specification** wizard appears.

Create Tunnel Specifications Save Cancel

Name

Tunnel Type

Destination IP Address

Key

3. Enter or select the following information:

Field	Description
Name	The name of the tunnel endpoint.
Tunnel Type	Select L2GRE, VXLAN, or TLS-PCAPNG tunnel type to create a tunnel.
Destination IP Address	Enter the IP address of the destination endpoint
Key	Enter a value for the tunnel key

4. Click **Save** to save the configuration.

Configure Traffic Policy

To create a UCT-C Traffic Policy in GigaVUE-FM:

1. From the GigaVUE-FM left navigation pane, select **Traffic > CONTAINER > Universal Cloud Tap - Container**. The **Policies** page appears.
2. In the **Policies** page, click **Create**. You can create a maximum of eight policies per monitoring domain. The Create Policy wizard appears.
3. In the **General** tab, enter or select the required information as described in the following table:

Fields	Description
Policy Name	Enter a name for the Traffic Policy. The name must be unique.
Monitoring Domain	Select an existing monitoring domain. To create a new monitoring domain, refer to Create Monitoring Domain section.
Connections	Select one or more connections for the policy. Once traffic policy is created for monitoring domain, you cannot add or delete connections in a monitoring domain.

4. Switch to the **Source Selectors** tab, select an existing source selector or select **Create New** to create a new source selector, refer to [Create Source Selectors](#) section for detailed information. You can configure a maximum of eight source selectors per policy.

- Switch to the **Rules** tab, enter or select the required information for the **Ingress Rules** and the **Egress Rules** as described in the following table. You must select CA in the Monitoring Domain page to use secure tunnel in rules:

Fields	Description
<p>Rules</p> <p>On the Ingress or Egress rules, click  to add another rule and click  to remove an existing rule. You must select CA in the Monitoring Domain page to use secure tunnel in rules.</p>	
Rule Name	<p>Enter a name for the rule.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <p>NOTE: Rule names ending with __I, __E, __RI, __RE are not recommended as the names are invalid in policy rules.</p> </div>
Enable	Select On to enable the filter or select Off to disable the filter
Action	Select Pass to allow the packets or select Drop to block the packets based on the filters.
Direction	<p>Select any one of the following directions:</p> <ul style="list-style-type: none"> ● Bi-directional - Taps the traffic in both directions. The maximum number of rules supported per direction is 32. Also, each directional rule will add 2 ingress rules and 2 egress rules. ● Ingress- Taps the ingress traffic. ● Egress - Taps the egress traffic. ● Ingress Pass All - Taps all the ingress traffic. ● Egress Pass All - Taps all the egress traffic.
Priority	Enter a priority value to specify the precedence.
Tunnel Specifications	Select an existing tunnel or select Create New to create a new tunnel, refer to Create Tunnel Specifications section for detailed information.
<p>Filters</p> <p>On the rule section, click  to add another filter and click  to remove an existing filter.</p>	
Filter Type	Select a filter type
Filter Name	Enter a name for the filter
Value	Enter a value for the filter

- Switch to the **Deploy** tab, click **Deploy** and the selected traffic policy rules get deployed to the required UCT-C taps present on the nodes corresponding to the source pods selected for monitoring.

The Traffic Policy processes the customer workload traffic and UCT-C forwards the traffic to the tunnel destination IP address.

NOTE: When there are two or more policies configured within the same tunnel, you cannot edit the tunnel specifications that are shared in the policies. In such cases, delete all the policies sharing the same tunnel specifications, modify the existing tunnel specifications, and create new policies for the policies that are deleted using the modified tunnel specifications.

Traffic Policy Statistics

Traffic Policy Statistics in the GigaVUE-FM provides the visibility of the policies within a Monitoring Domain and displays the information of the policies and its rules statistics in the dashboard.

Rules are configured in the UCT-C to either forward the traffic to a Tunnel or drop the flow of the traffic.

The activities of the rules are reflected by the statistics counters. The statistics counters show how the policy statistics are directly co-related to the policy and its rules being configured through the GigaVUE-FM.

Viewing Policy Statistics

To view the statistics of the traffic policy configured in the GigaVUE-FM, do the following steps:

1. Go to **Traffic > Container > UCT-C**. The **Policies** page appears. In the policy page, you can view various details related to a policy such as **Name, Monitoring Domain, Connection, Status**, etc., For each policy, the value correspond to the aggregate value of UCT-C taps associated with that policy. The fields and the description of the field names are given in the following table:

Table 1:

Fields	Description
Name	Name of the Policy
Monitoring Domain	Monitoring Domain associated with the Policy.
Connection	The connection associated with the policy.
Status	Specifies whether the policy deployment is : <ul style="list-style-type: none"> • Success • Failure • No Target Selected
UCT-C Deployment Details	Specifies the count of successful deployment along with the total number of deployment for a policy.
Ingress packets	Total aggregate value of the ingress packets associated with the policy.

Fields	Description
Egress packets	Total aggregate value of the egress packets associated with the policy.
Rx Dropped	Total aggregate value of the ingress packets dropped associated with the policy
Ingress Dropped	Total aggregate value of the ingress packets dropped associated with the policy
Tx Dropped	Total aggregate value of the egress packets dropped associated with the policy.
Egress Dropped	Total aggregate value of the egress packets dropped associated with the policy.
Ingress Bytes	Total aggregate value of the ingress bytes associated with the policy.
Egress Bytes	Total aggregate value of the egress bytes associated with the policy.
Ingress Errors	Total aggregate value of the ingress errors associated with the policy.
Egress Errors	Total aggregate value of the egress errors associated with the policy.

NOTE: Click the Gear icon  to add or remove column or columns as per your requirement.

2. Click the **name** of a policy to view the statistics of the policy. The statistics appears on the bottom of the **Policies** page.

You can view the following tabs along with the policy name:

- [Source Specifications](#)
- [Rules](#)

You can scroll each of the tables to view more columns. The fields and description for the tab that appears when you click the tabs are described in the topics respectively.

Source Specifications

You can view the criteria based on which a pod is selected for tapping.

The fields and descriptions of the source specifications tab are described in the following table:

Table 2:

Tab-	Field	Description
Source Specifications		
Source Selector		
	Name	Specifies the name of the Source selector.
Include Criteria		
	Criteria Name	Specifies the include criteria for the source selector. Pod that matches the include criteria is part of the source for the given traffic policy.
	Property	Specifies the attributes of the pod. The available

Tab-Source Specifications	Field	Description
		attributes are: service
	Operator	Specifies the operator used in the criteria.
	Value	Specifies the value for the attributes in the criteria.
Exclude Criteria		
	Criteria Name	Specifies the exclude criteria for the source selector. Pod that matches the exclude criteria will be excluded from the source for the given traffic policy.
	Property	Specifies the property in the exclude criteria based on which the pod associated with the source is excluded.
	Operator	Specifies the operator involved in the exclude criteria in tapping the traffic in the pod.
	Value	Specifies the value in the criteria based on which traffic in the pod is excluded.

Rules

You can view the aggregate value of all the rules the policy has been configured for the node in the UCT-C tap present in a cluster. The fields and descriptions of the source specifications tab are described in the following table:

Table 3:

Tab-Rules	Field	Description
<i>Rules</i>		
Rules		
	Name	Specifies the name of the rules in which the traffic is filtered in the pod
	Tunnel Specifications	Specifies the tunnel details which is associated with the rules to send the traffic out. When you hover over the tunnel specification value, you can view the details of the tunnel in a message box
	Priority	Specifies the priority assigned for the rule.
	Pass/Drop	Specifies whether to pass or drop the rule.
	Filters	Specifies the parameters used in the rule. When you hover over the filter value, you can view the details of the filters in a message box.

Tab-Rules	Field	Description
Rules		
	Direction	Specifies the direction of the flow of traffic is ingress, egress, or in both direction.
	Ingress Packets	Specifies the aggregate value of the ingress packets associated with the rules.
	Egress Packets	Specifies the aggregate value of the egress packets associated with the rules.
	Ingress Dropped	Specifies the aggregate value of the ingress packets dropped associated with the rules.
	Egress Dropped	Specifies the aggregate value of the egress packets dropped associated with the rules.
	Ingress Errors	Specifies the aggregate value of the ingress errors associated with the rules.
	Egress Errors	Specifies the aggregate value of the egress errors associated with the rules.

Precription™

License: Requires **SecureVUE Plus** license.

Gigamon Precription™ technology¹ redefines security for virtual, cloud, and containerized applications, delivering plain text visibility of encrypted communications to the full security stack, without the traditional cost and complexity of decryption.

This section explains about:

- [How Gigamon Precription Technology Works](#)
- [Why Gigamon Precription](#)
- [Key Features](#)
- [Key Benefits](#)
- [Precription Technology on Single Node](#)
- [Precription Technology on Multi-Node](#)
- [Supported Platforms](#)

¹**Disclaimer:** The Precription feature allows users to acquire traffic after it has been decrypted. This traffic can be acquired from both virtual machine (VM) and container-based solutions, and is then sent to the V Series product for further processing. The Precription feature provides an option to use encrypted tunnels for communication between the acquisition (via UCT or G-vTAP) of unencrypted traffic and the traffic processing (at the V Series) which will better safeguard the traffic while in transit. However, if a user does not use the option for encrypted tunnels for communication, decrypted traffic will remain unencrypted while in transit between the point of acquisition and processing.

Please note that this information is subject to change, and we encourage you to stay updated on any modifications or improvements made to this feature.

By using this feature, you acknowledge and accept the current limitations and potential risks associated with the transmission of decrypted traffic.

- [Prerequisites](#)

How Gigamon Precryption Technology Works

Precryption technology leverages native Linux functionality to tap, or copy, communications between the application and the encryption library, such as OpenSSL.

In this way, Precryption captures network traffic in plaintext, either before it has been encrypted, or after it has been decrypted. Precryption functionality doesn't interfere with the actual encryption of the message nor its transmission across the network. There's no proxy, no retransmissions, no break-and-inspect. Instead, this plaintext copy is forwarded to the Gigamon Deep Observability Pipeline for further optimization, transformation, replication, and delivery to tools.

Precryption technology is built on GigaVUE® Universal Cloud Tap (UCT) and works across hybrid and multi-cloud environments, including on-prem and virtual platforms. As a bonus, UCT with Precryption technology runs independent of the application, and doesn't have to be baked into the application development life cycle.

Why Gigamon Precryption

GigaVUE Universal Cloud Tap with Precryption technology is a lightweight, friction-free solution that eliminates blind spots present in modern hybrid cloud infrastructure, providing East-West visibility into virtual, cloud, and container platforms. It delivers unobscured visibility into all encryption types including TLS 1.3, without managing and maintaining decryption keys. IT organizations can now manage compliance, keep private communications private, architect the necessary foundation for Zero Trust, and boost security tool effectiveness by a factor of 5x or more.

Key Features

The following are the key features of this technology:

- Plain text visibility into communications with modern encryption (TLS 1.3, mTLS, and TLS 1.2 with Perfect Forward Secrecy).
- Plain text visibility into communications with legacy encryption (TLS 1.2 and earlier).
- Non intrusive traffic access without agents running inside container workloads.

- Elimination of expensive resource consumption associated with traditional traffic decryption.
- Elimination of key management required by traditional traffic decryption.
- Zero performance impact based on cipher type, strength, or version.
- Support across hybrid and multi-cloud environments, including on-prem, virtual, and container platforms.
- Keep private communications private across the network with plaintext threat activity delivered to security tools.
- Integration with Gigamon Deep Observability Pipeline for the full suite of optimization, transformation, and brokering capabilities.

Key Benefits

The following are the key benefits of this technology:

- Eliminate blind spots for encrypted East-West (lateral) and North-South communications, including traffic that may not cross firewalls.
- Monitor application communications with an independent approach that enhances development team velocity.
- Extend security tools' visibility to all communications, regardless of encryption type.
- Achieve maximum traffic tapping efficiency across virtual environments.
- Leverage a 5–7x performance boost for security tools by consuming unencrypted data.
- Support a Zero Trust architecture founded on deep observability.
- Maintain privacy and compliance adherence associated with decrypted traffic management.

How Gigamon Precryption Technology Works

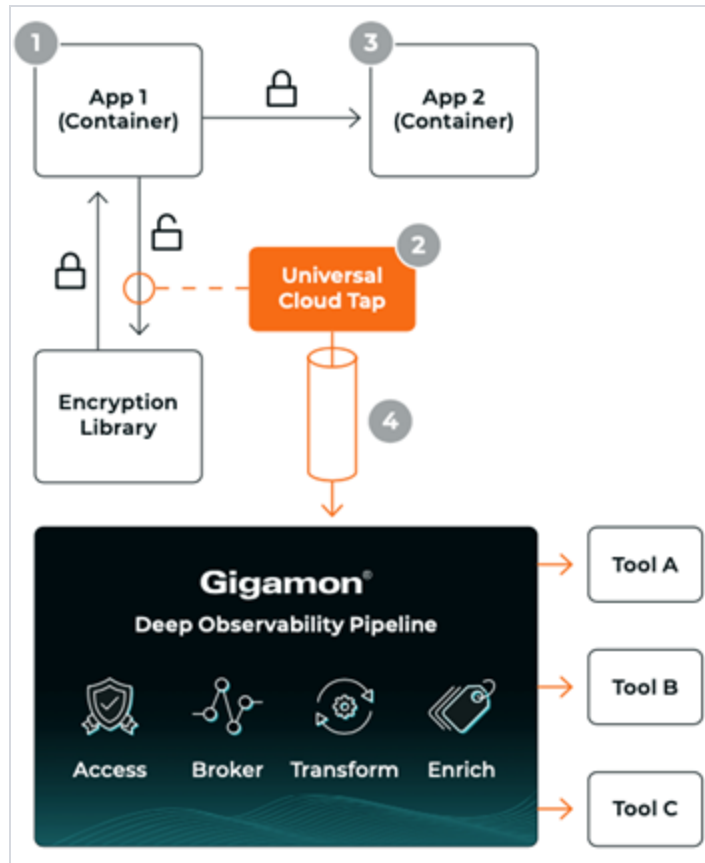

This section explains about how Precryption technology works on single node and multiple node in the following sections:

- [Precryption Technology on Single Node](#)
- [Precryption Technology on Multi-Node](#)

Precryption Technology on Single Node

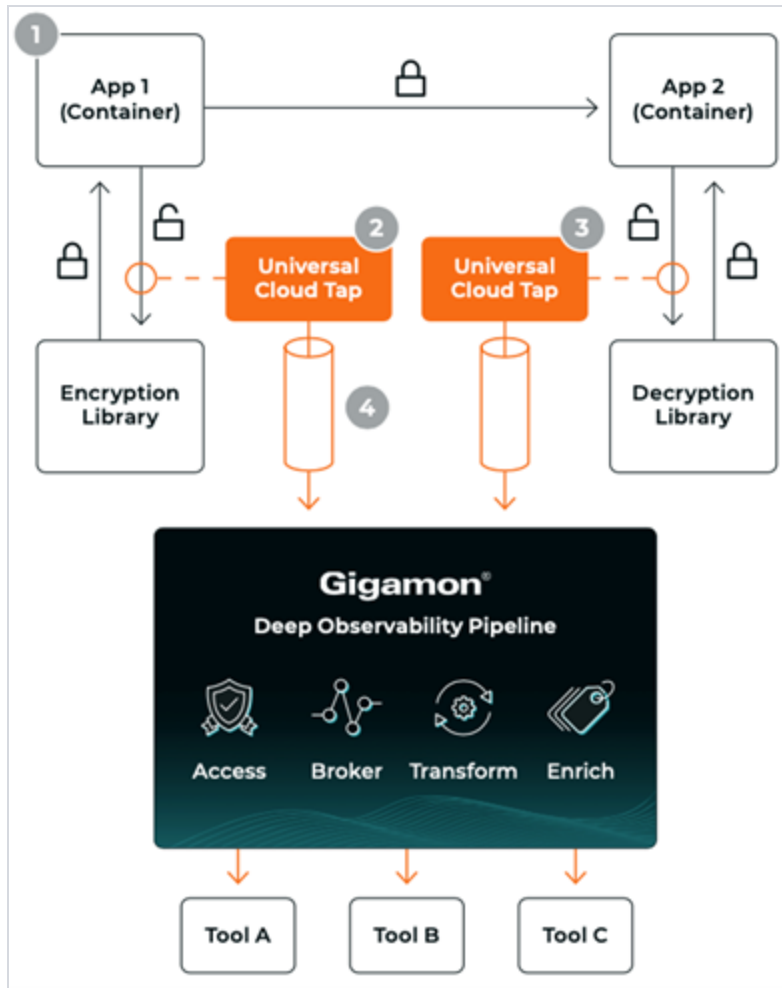

1. When any application needs to encrypt a message, it uses an encryption library, such as OpenSSL, to perform the actual encryption.
2. GigaVUE Universal Cloud Tap (UCT), enabled with Precryption technology, gets a copy of this message before it's encrypted on the network.
3. The encrypted message is sent to the receiving application, with unmodified encryption. No proxy, no re- encryption, no retransmissions.

4. GigaVUE UCT creates packet headers as needed, encapsulates in a tunnel, and forwards to GigaVUE V Series in the deep observability pipeline. Gigamon further optimizes, transforms, and delivers data to tools, without need for further decryption

Pre-encryption Technology on Multi-Node

1. When any application needs to encrypt a message, it uses an encryption library, such as OpenSSL, to perform the actual encryption.
2. GigaVUE Universal Cloud Tap (UCT), enabled with Pre-encryption, gets a copy of this message before it's encrypted on the network.
3. Optionally, GigaVUE UCT enabled with Pre-encryption can also acquire a copy of the message from the server end, after the decryption.
4. GigaVUE UCT creates packet headers as needed, encapsulates in a tunnel, and forwards to V Series in the deep observability pipeline where it is further enriched, transformed, and delivered to tools, without further decryption.

Supported Platforms

VM environments: Precryption™ is supported on the following VM platforms where UCT-V is supported:

Platform Type	Platform
Public Cloud	<ul style="list-style-type: none"> ● AWS ● Azure ● GCP (via Third Party Orchestration)
Private Cloud	<ul style="list-style-type: none"> ● OpenStack ● VMware ESXi (via Third Party Orchestration only) ● VMware NSX-T (via Third Party Orchestration only)

Container environments: Precryption™ is supported on the following container platforms where UCT-C is supported:

Platform Type	Platform
Public Cloud	<ul style="list-style-type: none"> ● EKS ● AKS
Private Cloud	<ul style="list-style-type: none"> ● OpenShift ● Native Kubernetes (VMware)

Prerequisites

Deployment Prerequisites

- OpenSSL version 1.0.2, version 1.1.0, version 1.1.1, and version 3.x
- For GigaVUE-FM, to capture the statistics, you must add the port 5671 in the security group
- Port 9900 should be enabled in security group settings on the UCT-V controller to receive the statistics information from UCT-V agent
- For UCT-C, you must add the port 42042 and port 5671 in the security group

License Prerequisite

- Precryption™ requires SecureVUE Plus license.

Supported Kernel Version

Precryption is supported for Kernel Version 5.4 and above for all Linux and Ubuntu Operating Systems. For the Kernel versions below 5.4, refer to the following table:

Kernel Version	Operating System
4.18.0-193.el8.x86_64	RHEL release 8.2 (Ootpa)
4.18.0-240.el8.x86_64	RHEL release 8.3 (Ootpa)
4.18.0-305.76.1.el8_4.x86_64	RHEL release 8.4 (Ootpa)
4.18.0-348.12.2.el8_5.x86_64	RHEL release 8.5 (Ootpa)
4.18.0-372.9.1.el8.x86_64	RHEL release 8.6 (Ootpa)
4.18.0-423.el8.x86_64	RHEL release 8.7 Beta (Ootpa)
4.18.0-477.15.1.el8_8.x86_64	RHEL release 8.8 (Ootpa)
5.3.0-1024-kvm	ubuntu19.10
4.18.0-305.3.1	Rocky Linux 8.4
4.18.0-348	Rocky Linux 8.5
4.18.0-372.9.1	Rocky Linux 8.6
4.18.0-425.10.1	Rocky Linux 8.7
4.18.0-477.10.1	Rocky Linux 8.8

Kernel Version	Operating System
4.18.0-80.el8.x86_64	centos 8.2
4.18.0-240.1.1.el8_3.x86_64	centos 8.3
4.18.0-305.3.1.el8_4.x86_64	centos 8.4
4.18.0-408.el8.x86_64	centos 8.5

Note

- See the [Configure Precryption in UCT-V](#) section for details on how to enable Precryption™ in VM environments.
- See the [Configure Precryption in UCT-C](#) section for details on how to enable Precryption™ in container environments.
- See how [Secure Tunnels](#) feature can enable secure delivery of precrypted data.

Configure Precryption in UCT-C

GigaVUE-FM allows you to enable or disable the Precryption feature.

Rules and Notes

The following are the memory limits to be applied to UCT-C:

- The memory limit changes depending on the numbers of vCPUs in the worker node. For example, if the worker node has 16 vCPUs, then the Precryption feature consumes around 1GB of memory (16 * 64 MB).
- When you deploy secure tunnels, it requires additional (16 *64 MB) memory. Hence, the total memory that you must allocate for the TAP is 1 GB.
- Protocol version IPv4 and IPv6 are supported.
- If you wish to use IPv6 tunnels, your GigaVUE-FM and the fabric components version must be 6.6.00 or above.

The YAML configuration option allows you to choose the amount of buffer size.

To configure the Precryption feature in UCT-C, follow the steps listed below:

1. Go to **Traffic > CONTAINER > Universal Cloud Tap - Container**.
2. On the Policies page that appears, click **Create**.
3. In the **General** tab, enter or select the required information as described in the following table:

Fields	Description
Policy Name	Enter a name for the Traffic Policy. The name must be unique.
Monitoring Domain	Select an existing Monitoring Domain. To create a new monitoring domain, refer to Create Monitoring Domain section in the UCT configuration guide. Only one Precryption Policy is allowed per Monitoring Domain
Connections	Select one or more connections for the policy. Once traffic policy is created for a Monitoring Domain, you cannot add or delete connections in the Monitoring Domain.
Precryption Policy	Click the radio button Yes , to enable the Precryption Policy ,

After enabling the Precryption, configure the **Source Selectors**, and the **Rules**. In this release, for Rules, Pass All option is supported.

Secure Tunnels

Secure Tunnel securely transfers the cloud captured packets on UCT-V and UCT-C to a GigaVUE V Series Node or Tool (only in case of UCT-C). The data from UCT-V and UCT-C are encapsulated in PCAPng format, and the encrypted data is sent over a TLS connection to a GigaVUE V Series Node.

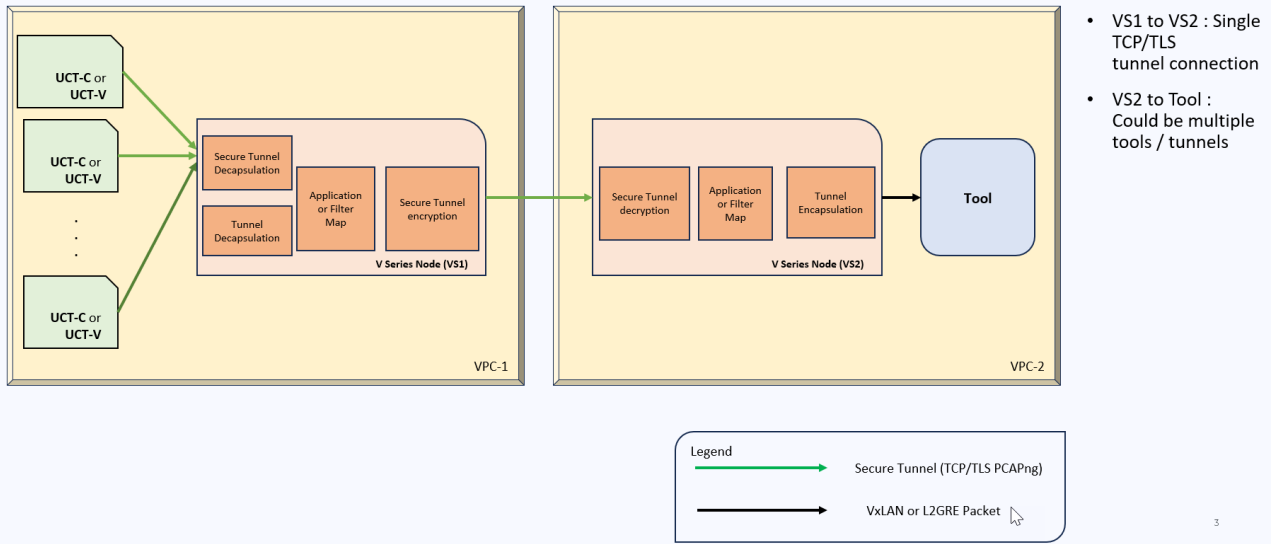

Secure Tunnel can also transfer the cloud captured packets from a GigaVUE V Series Node to another GigaVUE V Series Node.

In case of GigaVUE V Series Node to GigaVUE V Series node, the traffic from the GigaVUE V Series Node 1 is encapped using PCAPng format and transported to GigaVUE V Series Node 2 where the traffic is decapped. The secure tunnels between V Series Node to V Series Node have multiple uses cases.

The GigaVUE V Series Node decapsulates and processes the packet per the configuration. The decapsulated packet can be sent to the application such as De-duplication, Application Intelligence, Load balancer and to the tool. The Load Balancer on this node can send the packets to multiple V Series Nodes, in this case the packets can be encapsulated again and sent over a secure tunnel.

Secure Tunnel Use Case

Tool in remote Virtual Private Cloud (VPC) – Single V Series Node

Supported Platforms

Secure tunnel is supported on:

- OpenStack
- Azure
- AWS
- VMware NSX-T (only for Third Party Orchestration)
- VMware ESXi (only for Third Party Orchestration)
- Nutanix (only for Third Party Orchestration)
- Google Cloud Platform (only for Third Party Orchestration)

For information about how to configure secure tunnels, refer to the section [Configure Secure Tunnel in UCT-C](#).

Configure Secure Tunnel in UCT-C

Secure tunnel can be configured on:

- [Preencrypted Traffic](#)
- [Mirrored Traffic](#)

Preencrypted Traffic

You can send the preencrypted traffic through secure tunnel. When secure tunnel for Preencryption is enabled, packets are framed and sent to the TLS socket. PCAPng format is used to send the packet.

When you enable the secure tunnel option for both regular and Precryption packets, then two TLS secure tunnel sessions are created.

It is recommended to always enable secure tunnels for precrypted traffic to securely transfer the sensitive information.

For more information about PCAPng, refer to [PCAPng Application](#).

Mirrored Traffic

You can enable the Secure Tunnel for mirrored traffic. By default, Secure Tunnel is disabled.

Prerequisites

While creating Secure Tunnel, you must provide the following details:

- SSH key pair
- CA certificate

Configure Secure Tunnel from UCT Container to GigaVUE V Series Node

To configure a secure tunnel in a UCT Container, you must configure one end of the tunnel to the UCT-C and the other end to a GigaVUE Cloud Suite V Series node. You must configure CA certificates in UCT Container, and the private keys and SSL certificates in the GigaVUE Cloud Suite V Series Node. Refer to the following steps for configuration:

S. No	Task	Refer to						
1	Upload a Custom Certificate	<p>You must upload a CA to UCT Container for establishing a connection with the GigaVUE Cloud Suite V Series node.</p> <p>To upload the CA using GigaVUE-FM follow the steps given below:</p> <ol style="list-style-type: none"> Go to Inventory > Resources > Security > CA List. Click New, to add a new Certificate Authority. The Add Certificate Authority page appears. Enter or select the following information. <table border="1" data-bbox="732 520 1446 718"> <thead> <tr> <th>Field</th> <th>Action</th> </tr> </thead> <tbody> <tr> <td>Alias</td> <td>Alias name of the CA.</td> </tr> <tr> <td>File Upload</td> <td>Choose the certificate from the desired location.</td> </tr> </tbody> </table> Click Save. <p>For more information, refer to the section Adding Certificate Authority</p>	Field	Action	Alias	Alias name of the CA.	File Upload	Choose the certificate from the desired location.
Field	Action							
Alias	Alias name of the CA.							
File Upload	Choose the certificate from the desired location.							
2.	Upload a SSL Key	You must add a SSL key to GigaVUE Cloud Suite V Series node. To add SSL Key, follow the steps in the section SSL Decrypt..						
3	Selecting the SSL Key when you create a monitoring domain and configure the fabric components in GigaVUE-FM.	To select the SSL Key follow the steps in the section						
4	Selecting the CA certificate when you create a monitoring domain and configuring the fabric components in GigaVUE-FM.	You should select the added Certificate Authority (CA) in UCT-V Controller. To select the CA certificate, follow the steps in the section UCT-C and GigaVUE-FM Interaction						
5.	Creating and adding the secure tunnel when you configure the traffic policy.	To create and add the secure tunnel while configuring in , in UCT Container refer to the Configure Traffic Policy						

Adding Certificate Authority

This section describes how to add Certificate Authority in GigaVUE-FM.

CA List

The Certificate Authority (CA) List page allows you to add the root CA for the devices.

To upload the CA using GigaVUE-FM follow the steps given below:

1. Go to **Inventory > Resources > Security > CA List**.
2. Click **Add**, to add a new Custom Authority. The **Add Certificate Authority** page appears.
3. Enter or select the following information.

Field	Action
Alias	Alias name of the CA.
File Upload	Choose the certificate from the desired location.

4. Click **Save**.

Configure UCT-C Settings

You can configure the following UCT-C settings in GigaVUE-FM:

- [UCT-C General Settings](#)
- [Configure UCT-C Settings](#)

UCT-C General Settings

In GigaVUE-FM, you can control the number of permitted connections, refresh intervals and purge time intervals of the UCT-C solution. You can specify the purge interval to automatically remove the UCT-Cs that are disconnected for a long duration.

NOTE: GigaVUE-FM generates an alarm for the disconnected UCT-C When three consecutive heartbeats are missed. Refer to "Alarms" topic in the *GigaVUE Administration Guide* for detailed information on Alarms.

To edit the UCT-C general settings:

1. In GigaVUE-FM, navigate to **Inventory > CONTAINER > Universal Cloud Tap - Container > Settings**, the **Settings** page appears with the existing General settings and UCT-C information.
2. On the **Settings** page, on the **General** section, click **Edit**. The Edit General Setting's quick view appears.
3. To exclude the pods from monitoring, provide the source criteria. In **Criteria 1**, from the drop-down list box, select any of the following **Object Property** to exclude them from the monitoring domain, and provide the value for the property selected in the **Value** field:

- o pod name
- o pod ip
- o pod labels
- o node name
- o namespace

NOTE: By default pods in kube-system namespace, metallb-system namespace and pod name containing nginx are excluded from monitoring.

4. Edit the required values in the **General Settings** section.

Field	Description
Maximum number of connections allowed	Enter the maximum number of connections allowed in the UCT-C solution
Purge time interval for disconnected UCT-Cs (days)	Enter a value for the purge time interval for the disconnected UCT-Cs in days

5. Click **Save** to save the updates made on the General Settings.

UCT-C Log Level Settings

In GigaVUE-FM, you can control the level of logs created at each individual UCT-C for troubleshooting. The regular UCT-C log file name format is **uct_tap.log**.

To view or edit the UCT-C log level settings:

1. In GigaVUE-FM, navigate to **Inventory > CONTAINER > Universal Cloud Tap - Container > Settings**, the **Settings** page appears with the existing General settings and UCT-C information.
2. On the **Settings** page, on the **UCT-C** section, on any monitoring domain, click on the UCT-C fabric. The UCT-C setting's quick view appears.

The screenshot shows a configuration window titled 'UCT: [ID]' with 'Cancel' and 'Save' buttons. Under the 'Individual Settings' section, there is a note: 'Individual setting will apply to this UCT only. When applying settings to a group try to consider the performance impact.' Below this, the 'LOGGING' section contains two settings: 'Log Level' set to 'DEBUG' with a dropdown arrow and a 'Reset' button, and 'Log File Size' set to '1000000' with a 'Reset' button.

3. Edit the required UCT-C log values in the **LOGGING** section.

Field	Description
Log Level	Select one of the following: <ul style="list-style-type: none"> • DEBUG—fine-grained log information for application debugging • INFO—coarse-grained log information for highlighting application progress • WARN—log information of potentially harmful situations • ERROR—log information of the error events that allows the application to run continuously • FATAL—log information of very severe error events that presumably lead the application to abort.
Log File Size	Enter a value for the number of lines in the UCT-C log file.

On any of the above fields, click **Reset** to reset the value to default.

Upgrade UCT-C

To upgrade UCT-C, you must perform the following steps:

1. **Upgrade to GigaVUE-FM 6.7.00:** Before upgrading GigaVUE-FM from versions earlier than 6.4.00.03, delete the UCT-C Monitoring Domain, Policy, UCT-C Controller and UCT-C Tap, and then upgrade GigaVUE-FM to 6.7.00. To upgrade the GigaVUE-FM in respective cloud platforms, refer to [GigaVUE-FM Installation and Upgrade guide](#).
2. **Upgrade to UCT-C 6.7.00:** To upgrade UCT-C to 6.7.00, you must delete the older versions and deploy UCT-C 6.7.00 version. To deploy UCT-C, refer to [Steps to Delete and Redeploy UCT-C](#). GigaVUE-FM 6.7.00 is compatible only with UCT-C 6.7.00.

Steps to Delete and Redeploy UCT-C

1. Delete the UCT Controller deployment.

```
kubectl get deployment -A  
kubectl delete deployment <uct-controller name> -n <namespace>
```

2. Delete the UCT Tap daemonset.

```
kubectl get daemonset -A  
kubectl delete daemonset <uct-tap-name> -n <namespace>
```

3. Delete the UCT controller service.

```
kubectl get services -A  
kubectl delete services <uct-cntlr-service-name> -n <namespace>
```

4. Deploy the UCT controller/UCT Tap using helm chart or YAML file.

- a. To install using Helm chart:

```
helm install uctc-cntlr uctc-cntlr/  
helm install uctc-tap uctc-tap/
```

- b. To install using YAML.

```
kubectl apply -f <uctc_controller_yaml_file>  
kubectl apply -f <uctc_tap_yaml_file>
```

5. Delete the ingress rule and redeploy it using YAML to point to the right service (uctc-cntlr-service).

```
kubectl get ingress -A
kubectl delete ingress <uct-cntlr-ingress-name> -n <namespace>
uctc-ingress.yaml
apiVersion: networking.k8s.io/v1
kind: Ingress
metadata:
  annotations:
    kubernetes.io/ingress.class: nginx-uct-ns
    nginx.ingress.kubernetes.io/backend-protocol: HTTPS
    nginx.ingress.kubernetes.io/proxy-connect-timeout: "360000"
    nginx.ingress.kubernetes.io/proxy-read-timeout: "360000"
    nginx.ingress.kubernetes.io/proxy-send-timeout: "360000"
    nginx.ingress.kubernetes.io/rewrite-target: /
    nginx.ingress.kubernetes.io/secure-backends: "false"
    nginx.ingress.kubernetes.io/ssl-passthrough: "true"
  generation: 1
  name: uctc-cntlr-ingress
  namespace: uct-ns
spec:
  rules:
  - http:
      paths:
      - backend:
          service:
            name: uctc-cntlr-service
            port:
              number: 8443
          path: /
          pathType: ImplementationSpecific
    status:
      loadBalancer: {}
  kubectl apply -f <ingress_rule_yaml_file>
```

6. Restart the nginx controller and backend.

```
kubectl get pods -A
kubectl rollout restart deployment nginx-controller -n <namespace>
kubectl rollout restart deployment nginx-ingress-default-backend -n
<namespace>
```

7. Redeploy the policy.

How to Download Software and Release Notes from My Gigamon

Registered Customers can download software and corresponding Release Notes documents from the **Software & Release Notes** page on to [My Gigamon](#). Use the My Gigamon Software & Docs page to download:

- Gigamon Software installation and upgrade images,
- Release Notes for Gigamon Software, or
- Older versions of PDFs (pre-v5.7).

To download release-specific software, release notes, or older PDFs:

1. Log in to [My Gigamon](#).
2. Click on the **Software & Release Notes** link.
3. Use the **Product** and **Release** filters to find documentation for the current release. For example, select Product: "GigaVUE-FM" and Release: "5.6," enter "pdf" in the search box, and then click **GO** to view all PDF documentation for GigaVUE-FM 5.6.xx.

NOTE: My Gigamon is available to registered customers only. Newer documentation PDFs, with the exception of release notes, are all available through the publicly available online documentation.

Documentation Feedback

We are continuously improving our documentation to make it more accessible while maintaining accuracy and ease of use. Your feedback helps us to improve. To provide feedback and report issues in our documentation, send an email to: documentationfeedback@gigamon.com

Please provide the following information in the email to help us identify and resolve the issue. Copy and paste this form into your email, complete it as able, and send. We will respond as soon as possible.

Contact Technical Support

For information about Technical Support: Go to **Settings**  **> Support > Contact Support** in GigaVUE-FM.

You can also refer to <https://www.gigamon.com/support-and-services/contact-support> for Technical Support hours and contact information.

Email Technical Support at support@gigamon.com.

Contact Sales

Use the following information to Gigamon channel partner or Gigamon sales representatives.

Telephone: +1.408.831.4025

Sales: inside.sales@gigamon.com

Partners: www.gigamon.com/partners.html

Premium Support

Email Gigamon at inside.sales@gigamon.com for information on purchasing 24x7 Premium Support. Premium Support entitles you to round-the-clock phone support with a dedicated Support Engineer every day of the week.

The VÜE Community

The **VÜE Community** is a technical site where Gigamon users, partners, security and network professionals and Gigamon employees come together to share knowledge and expertise, ask questions, build their network and learn about best practices for Gigamon products.

Visit the VÜE Community site to:

- Find knowledge base articles and documentation
- Ask and answer questions and learn best practices from other members.
- Join special-interest groups to have focused collaboration around a technology, use-case, vertical market or beta release
- Take online learning lessons and tutorials to broaden your knowledge of Gigamon products.
- Open support tickets (Customers only)
- Download the latest product updates and documentation (Customers only)

The VÜE Community is a great way to get answers fast, learn from experts and collaborate directly with other members around your areas of interest.

Register today at community.gigamon.com

Questions? Contact our Community team at community@gigamon.com.
